## IBM to bet PC chips on 486

BY WILLIAM BRANDEN  
and DOUGLAS BARNEY  
OF ENR

NEW YORK — IBM is expected to try to regain the image of technological leadership in the personal computer market by introducing a plug-in board that boosts its Personal System/2 Model 70 A21 with Intel Corp.'s 1486 processor. IBM plans to be the first PC vendor out of the gate with an 1486-based introduction this week at PC Expo, four sources confirmed independently.

A source at an independent software firm, claiming to have seen the 1486 module last week, said IBM has designated it the Power Platform. The computer giant, the sources said, is trying to offset perceptions that it is lagging in the PC market with an aggressive move to leapfrog rival Compaq Computer Corp.

In one of IBM's most aggressive marketing moves to date,

the company will promise to double the performance of its PS/2 with a chip that is still several months away from delivery.

IBM Chairman John Akers "is telling the world, 'We won't be the last ones to ship this product,'" said David Wu, an analyst at S. G. Warburg & Co., a Wall Street brokerage firm. "He's sick of Compaq kicking him in

the shin."

IBM currently trails Compaq in 80386-based system sales, according to Storeboard, Inc., a Dallas-based company that tracks PC sales in U.S. dealerships. According to Storeboard figures, IBM had 31.9% of units shipped and 33.2% of revenues in April, while Compaq had 31.9%.

Continued on page 8

### Leapfrogging

With its expected 1486-based system, IBM will capitalize on a number of performance advantages over the Intel 80386

- Runs 80386-based software with a two- to fourfold increase in performance
- Partial RISC design executes some instructions in single clock cycle
- On-chip cache reduces memory cycles
- On-chip floating-point unit is compatible with 80387 math coprocessor

## Swollen inventories come back to haunt Ashton-Tate

BY DOUGLAS BARNEY  
OF ENR

TORRANCE, Calif. — If the adage "when it rains, it pours" is true, then Ashton-Tate Corp. got drenched last week after admitting that it expects a loss of \$15 million for the current quarter and a possible loss for the year.

The expected loss is largely attributable to excess inventory and lagging demand for the flagship Dbase IV product, which continues its fierce uphill battle for broad market acceptance.

Ashton-Tate Chairman Ed Esher has called the personal computer database management systems market a war. His firm apparently made a tactical error when it overestimated demand

for Dbase IV 1.0 at the same time that customers chose to wait for the upcoming version, which adds crucial features. The result was a distribution channel full of unsold inventory.

Swollen new orders coming into Ashton-Tate. "It was a combination of our optimism and the channel's optimism," Esher said. "The loss ends a long and successful streak for Ashton-Tate, but they're not out of the woods yet. They still have competition for PC database dollars intensified, but Dbase IV has been up to its ears in Dbase and pre-

## Can AS/400 avoid sophomore slump?

BY ROSEMARY HAMILTON  
and ROBERT MORAN  
OF ENR

As the Application System/400 celebrates its first anniversary this week, IBM has cause to rejoice and worry at the same time. IBM intended to win a respectable slot in the midrange market with the AS/400, and it did just that. It so successfully launched its first anniversary product glitch that most users, even those who now report hellish migrations, now describe themselves as satisfied customers.

However, unless IBM addresses some lingering AS/400 problems soon, it could start to lose the momentum it built, observers said last week.

Users and analysts contacted gave the midrange line an overall thumbs-up, but they said there remain two outstanding flaws with the AS/400 that could set off causing users to pull out a purchase or force them to look elsewhere.

The first problem is migration from the System/36, which IBM concedes has been an unnecessarily difficult task. The second is an inadequate tape-drive subsystem, which has frustrated most high-end users and now has some looking to other vendors for help.

## Kodak may farm out IS centers

Talks with EDS, IBM  
enter the final stages

BY CLINTON WILDER  
OF ENR

ROCHESTER, N.Y. — Eastman Kodak Co. is negotiating with Electronic Data Systems Corp. and IBM for a contract under which one of the two will consolidate and run some or all of Kodak's information systems operations here. The contract could be announced within a month.

If consummated, the agreement would make Kodak, ranked 18th in the Fortune 500, one of the largest firms to choose an outside vendor for a full-service IS facilities management contract.

Kodak is a longtime EDS customer for various financial and manufacturing systems development projects. The current negotiations grew out of that relationship, and then IBM entered the game. No formal bid process has taken place, as it did with Merrill Lynch & Co.'s recent telecommunications contract award to MCI Communications Corp. and EDS (CW, June 12).

"We have been talking to EDS for a few months now about doing something beyond the nor-

## UPDATE

**T**rouble in la-la land? Maybe. Key elements of the small systems market appear to be in broad retreat. Sun Microsystems is learning the hard lessons of runaway growth and the internal disarray it can provoke. Ashton-Tate has hit the wall and will be smeared with red ink this quarter and perhaps next. IBM may actually leapfrog the PC clone community — itself in disarray — with the first Intel 80486-based systems package. Meanwhile, elements of the mainframe market are showing signs of renewed life. Does anyone have a computer industry barometer that works?

*Heine McCubbe hopes to save \$500K a year with new network. Page 69.*

# EXECUTIVE BRIEFING

■ **Kodak contemplates farming out its data center operations to Electronic Data Systems or IBM.** If an agreement is reached, Kodak will be one of the largest companies to join the growing movement to contract data center operations to a third party. Page 1.

■ **The bundling issues rise again, 20 years after IBM surrendered to industry pressure and unbundled its software.** The 1969 move created the third-party software industry and changed the computing world. Page 6. However, some vendors are up in arms again about recent moves by DEC and IBM to fold database management software into their operating systems. For the moment, users do not seem to care. Page 6.

■ **The AS/400 also celebrates an anniversary this week.** One year after its introduction, the machine has sold well to System/38 users, but tape storage and System/36 migration problems cloud its future. IBM says it will quickly address both issues. Page 1.

■ **As their worlds collide, vendors of both PC and large-system database management systems are trying to position themselves as the ideal providers for the corporate database.** The confrontation will benefit corporate DBMS buyers, although choosing a product remains difficult. Page 63.

■ **The Class of 1989 may actually be virus carriers.** IS managers may want to ensure that their companies' new hires don't bring with them virus-infected software that they used during their college days. Page 37.

■ **Managing the Mac environment is a growing IS specialty.** Superficially similar to managing IBM and compatible PCs as well as other systems, the job also carries an aura of uncertainty. The Mac may transform the mid-managed office worker into a counter-culture Mac activist. But managing the Mac environment requires only a slightly different perspective on the manager's part along with a strong ability to deal with the unique Mac elements. Page 75.

■ **Speaking of managing the Mac, a new user organization has sprouted, fed in part by Apple funds, to address the concerns of managers responsible for large Mac installations.** MacIS held its inaugural meeting in Chicago last week. Page 107.

■ **The violence and repression in China has not had a measurable impact on the IS operations of joint China-U.S. business ventures operating there.** However, U.S. firms have withdrawn many managers, leaving some areas in "TS" without leadership. Page 109.

■ **Corporate information systems may be getting no respect from corporate executives, and that lack could contribute to the company's failure.** A researcher

# Users blast BOC monopolies

BY ELIZABETH MORWITT  
OF STAFF

**BOSTON**—Local exchange carriers need serious competition to force them to respond to user requirements for rates and service, and an aggressive, fast-moving breed of telepoint vendors

J. Pauline Lombardi  
Golden State's Compello

may be the ones to provide it, several telecommunications users said last week.

At the Association of Data Communications Users (ADCU) conference here, speakers criticized exchange carriers' essential monopolies over local line

services in major metropolitan areas.

"I'm subscribing to service in New York City, I think I would like to have 30% of those losses provided by non-BOC companies," said John Compello, vice-president of waste products at Golden State, Sack and Co. and chairman of ADCU's Public Policy Committee. "Right now, the BOCs have about 95% ownership [of local lines], and we haven't seen trends in the last year to reduce that."

The Federal Communications Commission should not let local exchange carriers into information services until there is significant competition from "telepoint-like services," Compello added.

A growing number of telepoint companies are competing with the Bell operating companies (BOC) for local loop customers in major cities, typically offering discounts as well as enhanced services that the BOCs may not have yet introduced.

Shearman & Sterling has been trying unsuccessfully for years to get services such as fractional T1 from New York Telephone, said telecommunications manager Ronald E. West.

Now, the New York law firm is considering fractional T1 offerings from Merrill Lynch Telepoint Technologies, Inc. and an aggressive newcomer, Metropolitan Fiber Systems, Inc. in Oakbrook, Ill.

Securities companies in New York have attracted a 35% reduction on their local services by using the Merrill Lynch Telepoint rather than New York Telephone, Compello said.

Teleports also provide large business with much-needed backup facilities for their metropolitan-area networks, said Henry Levine, a partner at Washington, D.C., law firm Morrison & Foerster. BOCs typically route all the lines from one customer's site through one central office, so that "if your central office is down, you're" too, Levine said.

Many of the benefits that teleports offer relate to their ability to offer end-to-end fiber networks, sources said. A number of BOCs are laying down fiber, but primarily between their own offices, while the majority of connections to user premises remain copper-based, West said.

On the other hand, telepoint services will only lay fiber to a customer's doorstep if they can get enough business from the building to justify the investment, West said. The good news is that teleports have lowered their minimum entry level to "less than five T1s," he added.

Surviving in the telepoint mar-

ket is tough, according to Teleport Communications-Boston spokesman Larry Bugden. "We're in a real dog-and-ender 'em battle,'" Bugden said. One of the competitors, competitors, Teleport Boston Corp., recently dropped out of sight—practically causing operations—industry sources said.

Still, the market has filled up recently with aggressive entries that are "likely to be viable," Bugden said. Teleport Communications is expanding into San Francisco, Miami and Los Angeles and is eyeing other cities, he added. Metropolitan Fiber Systems plans to have teleports in 12 cities by year's end. "If nothing else, we've made the BOCs more responsive to their customers," Bugden said.

## Dismissed exec loses school suit

BY J. A. SAVAGE  
OF STAFF

**FORT WORTH, Texas**—Former Data Processing Director Ray Harrison's \$10 million lawsuit against the Arlington Independent School District for all alleged discrimination, breach of contract and wrongful discharge was dismissed late last month.

Harrison was barred from his office by guards and suspended from his job three years ago. He claimed he was resisting pressure from the district's superintendent to buy an IBM System/38 and software from Phoenix-based Prescripton Learning Corp. Two years later, the school superintendent resigned from his job after it was revealed he took transcontinental trips sponsored by Prescripton Learning [CW, Nov. 28].

U.S. District Court Judge Eldon Mahon, in a decision dated May 31, ruled that Harrison has relinquished all rights to sue the school district when he accepted a \$109,000 dismissal settlement and released the district from any and all claims against it. Harrison said last week it is likely he will appeal.

Harrison's 20 claims included age discrimination, fraud and conspiracy. The case turned on the agreement issue, according to Don Buckman, attorney for the school district.

The court said that "evidence suggests the data processing operations under Mr. Harrison's supervision were in an ominous state of disarray. His department appeared to be at the mercy of a computer technician who worked socially and sporadically, often from a makeshift office at Denny's Restaurant."

## Ashton-Tate

FROM PAGE 1

racked with delays, reports of bugs and its inability to tie to back-end databases such as the Ashton-Tate/Microsoft SQL Server.

Eber decided Dbase IV against critics of its bugs. "It is the trying to judge a human being by a wart," said Eber, who argued that the bugs affected a small percentage of users.

Pressure on Ashton-Tate has only begun to intensify. With IBM increasingly aggressive, Microsoft Corp. and Lotus Development Corp. ready to hop in and the Dbase clones' ever vigilant efforts, competition in the PC DBMS could become brutal. Ashton-Tate has reached its database crossroads and must deliver reliable new-generation tools to prosper, observers said.

Financially, Ashton-Tate has lagged behind its competitors, growing only 9% in fiscal 1988, according to "Soft-letter," an industry newsletter. This compares with the 55.2% average growth rate for the top 10 independent software vendors, according to "Soft-letter."

The firm has long known it

had an inventory problem; it just did not know how big a problem it was. After surveying its dealers and distributors recently, Ashton-Tate decided to come clean, a move that forced its stock down some 20% in one day. "It is kind of like an alcoholic who stands up and says, 'I am so, and so, and I'm drunk, and I need

help,'" Eber said. Those buying Dbase IV are largely doing prototype work, at least among the U.S.'s largest firms, said a source close to Ashton-Tate. However, prototyping use does not generally create significant product demand.

Users are often simply happy with what they have got. For Sam Burton, who developed a hotel and resort reservation system, Clipper from Mustang-Act, Inc. is just the ticket.

Burton does not need the end-user-oriented improvements such as meaning and instead is focused on programming improvements. "I take the direction of Clipper," Burton said.

According to Framingham, Mass.-based International Data Corp. (IDC), by the end of January, Ashton-Tate had sold approximately 300,000 copies of Dbase IV.

But so far, half are still sitting in warehouses, said a dealer shelves, said IDC analyst Nancy McSharry.

Yearly year changed to coincide with calendar year. Financial years included in figures for last two quarters. \*Projected.

# Software industry born with IBM's unbundling

BY STANLEY GIBSON  
OF STAFF

In the late 1960s, the software industry was a small, offbeat, almost cottage industry with doubtful potential.

Then came June 23, 1969, which stands as Independence Day for software firms. That was the day IBM announced separate pricing for software, services and hardware.

"I was enthusiastic about it. Everybody likes to pay for only

what they use. However, as you unbundle, the cost of each part goes up," said Irv Sittin, vice-president of corporate administration at Actua Life and Casualty Co. in Hartford, Conn. "We've been concerned we would be nickle-and-dimed to death."

Faced with paying steep prices for programming work, many customers began to hire their own programming staffs. At Actua, Sittin instituted training programs to replace those previously provided by IBM.

However, he did not purchase third-party software at first but waited until 1976 to purchase Callinane Corp.'s IDMS.

Although a number of software firms were founded prior to the unbundling date, June 23 was the symbolic starting point in the scramble to build software, the companies to sell it and the fortunes to be made from it.

"It created the industry we're in. It was very difficult to sell software before," said Richard Lilly, who co-founded Software International in 1968 to sell manufacturing resource planning to large manufacturers.

There was no rush following IBM's conferring of legitimacy, said Tom Niss, president and chief executive officer of Cincom Systems, Inc. "We didn't see a tremendous movement into the business. The trend was well under way before."

Indeed, an International Data Corp. report in 1987 listed nine independent software vendors, stating that many more such firms existed and others were being founded monthly.

IBM's unbundling freed these independents and set a precedent for other hardware vendors, creating a tradition of charging separately for hardware and software. As a result, software created by third parties has driven platforms from other vendors, such as Digital Equip-

ment Corp.'s VAX systems.

By fostering a wide selection of software, the unbundling also greatly assisted the success of the IBM plug-compatible computer industry, when firms such as Anadarko Corp. introduced their systems in the mid-1970s.

For the pioneers in the "Class of '69," the early days were full of hectic, west-of-the-patsy adventure. Dodge, a former high school math teacher, recalled renting a tiny office and creating much of the original product and documentation himself. He would toss the software—a box full of punched cards—into his car and drive it to the local post office.

Dodge and other trailblazers would have remained in obscurity without the IBM move. Instead, a host of colorful figures sprang forth. Marty Goets, founder of Applied Data Research, Inc., a software developer whose products and legal efforts led in part to IBM's unbundling, gained a new standing in the industry.

Whether users desired un-

bundling or not is subject to opinion. "The users, the market insisted that it happen," said Frederic Whittington, an independent consultant in New York then employed at Arthur D. Little, Inc. Before their growing maturity led them to desire separate pricing, Whittington said, "Users wanted their hands held. They had very little confidence."

"There was almost no pressure from the users," countered Phil Dorn, president of Dorn Computer Consultants, Inc. in New York. "They didn't give a damn. I never heard any users yelling about software," said Dorn, at that time an information executive at Union Carbide Corp. and vice-president of the Share user group.

Many users figured that unbundling would cut costs. Although IBM initiated a 3% hardware price cut, most users saw no savings. Some saw increases. One reason prices went up was because the newly legitimized software vendors raised them. Lilly said, "We were doing consulting for \$300 a day. We heard IBM was going to charge \$280 a day for systems engineers, so we said, 'We've got to raise prices to \$400 per day!'"

## Behind the decision

IBM unbundled for a combination of reasons, said Howard Figueroa, IBM vice-president of commercial and industry relations, who worked on the IBM study that led to the recommendation to unbundle.

First, IBM was facing stiff development costs and a growing shortage of programmers to write software for its customers. In addition, the U.S. Department of Justice filed its 13-year-long antitrust suit in January 1969. Between January and June, Goetz's ADR and three other firms filed suit against IBM for restraining competition. All the suits mentioned IBM's single-package pricing. In addition, IBM felt it could make money selling software and services, Figueroa said.

But for IBM, the decision meant navigating uncharted waters. "Could you charge for software? Could you protect it with copyright? Those were questions that in 1969 were not fully answered," said Figueroa, who added, "There was concern about what the effect on our own revenues would be."

STANLEY GIBSON

## A threat to independence?

Independent U.S. vendors are concerned that IBM wants a piece of the lucrative pie for IBM mainframe software

U.S. & INTERNATIONAL DATA CORP.

# Software firms fear return to old ways

BY STANLEY GIBSON  
OF STAFF

By linking proprietary database management systems and operating systems, Digital Equipment Corp. and IBM have resurrected the specter of bundling. In doing so, they have aroused the ire of the independent software industry.

"The AS/400 set the trend, and DEC followed it. We are trying to suspend or reverse the trend," said Rod Pieper, vice-president at Software AG of North America, Inc. At Software AG's request, Adapco recently adopted a motion questioning the integrity of the vendors' claims. Pieper said Software AG will soon file an identical complaint with the European Economic Community.

Although the issue of bundling—charging one price for a number of components including both software and hardware—is of vital interest to independent software vendors, not all users are concerned.

"I haven't seen it as negative so far," said Jack Morgenstern, vice-president of information systems development at Merrill

Lynch & Co. in New York. Selling a DBMS with an operating system can eliminate the long evaluation process, he explained, adding, "The other side is that you get tied into one environment. That could be bad." He said competition in the software industry is too strong to be curtailed at this point.

However, James W. MacKay, corporate director of information systems at Reynolds Metals, Inc. in Richmond, Va., offered, "When there's no competition with IBM, they charge a premium price. It's getting increasingly difficult to buy non-IBM software and tie it into their systems."

IBM has linked a Communications Manager and Data Manager in OS/2 Extended Edition. Also, IBM sells the AS/400, which is its predecessor, System/36, includes a relational DBMS integrated with its oper-

ating system.

Although IBM's DB2 is not mentioned in Adapco's complaints, IBM has aggressively marketed it with its 370 family of mainframes, establishing it as a de facto standard. IBM shuns the word "bundling," but has said it will "tightly integrate" DB2 with its MVS/ESA operating system. IBM's success with DB2 has caused software firms to be alarmed at a hardware vendor's dominance selling a DBMS that runs on its own systems.

Earlier this year, DEC included a runtime version of RDB with its VMS operating system. Two weeks ago, DEC announced it would similarly offer an RDBMS based on Relational Technology, Inc.'s Ingres with its Ultrix version of Unix.

"It's account control," said Charles Bachman, president of Bachman Information Systems,

Cincom's Niss recalls early days of unbundling

Inc. in Cambridge, Mass. Hardware vendors are anxious to sell both the operating system and DBMS to users, because customers using those components historically buy many others from the same vendor, Bachman claimed.

IBM, not surprisingly, takes a different view. You can always say, "Why isn't every part separate?" said Robert Berland, IBM vice-president of software vendor strategy and support. "Where you draw the line has been the debate in the past and will probably be the debate in the future," Berland added.

Joe Menard, OSF/Ultrix marketing manager at DEC, defended his firm's actions. "We see this as a natural evolution of the operating system. A customer can choose to use it [the DBMS] or not use it. At the same time, he said, "We expect

we'll continue to see significant third-party sales."

"There is no question it is re-bundling, even though it is being charged for. They are bundling software with other software, if not with hardware," said Tom Niss, president and chief executive officer of Cincom Systems, Inc.

Despite the software vendors' agitation, an underlying technological trend is at work, which will be difficult to stop, according to Frederic Whittington, a New York-based independent consultant.

"Unbundling took place because customers were prepared to stop. Rebundling is happening because of commoditization," he explained. The increasingly generic quality of software and hardware is leading vendors to add value through packaging, he said.

# VMCENTER II: MASTER THE VM ENVIRONMENT.

## The #1 systems management tool for VM environments.

Storm clouds gathering over your data center? Don't wait for the deluge. Get VMCENTER II and stay in control for good.

VMCENTER II is a unique software product—an unmatched resource for managing all your VM operations. With VMCENTER II, you can simplify access without endangering security. Serve on DASD without compromising performance. Enhance service to users while streamlining administration. And control local and remote sites with unprecedented effectiveness.

With the VMCENTER II automated facilities, you can manage present-day operations more easily than ever. And in the time left over, plan for the future with confidence and accuracy—thanks to comprehensive online utilization and trend reports.

No wonder VMCENTER II is the most widely used systems management tool for VM environments. It's the single most important investment you can make in the quality and cost-effectiveness of your VM operations.

So why wait any longer? Gain the upper hand today. And keep the storm clouds at bay for years to come. For more information on VMCENTER II, call or write Systems Center, Inc., 1800 Alexander Bell Drive, Boston, Virginia 22081. A New York Stock Exchange Company.

## NEWS SHORTS

### Around it goes, where it stops . . .

Following the recommendation of an independent evaluation committee, much-troubled data drive vendor Miniscribe Corp. fired a group of officers and other employees last week and allowed another group — including company President and Director Gerald Goodson — to resign. The committee was created earlier this year to investigate both the allegations of a class-action suit now pending against the company and the company's financial operations. Last month, committee findings led to Miniscribe's warning that its past three years' worth of financial statements should not be trusted. A Miniscribe spokesman declined to identify the currently departing employees, the reasons for their severance or the number of employees affected.

### In English this time

What was that comment? Never mind. For those neophytes with little or no experience in on-line searching, Dowpoint just might be able to help. Using a new application running on a Thinking Machines Corp. supercomputer, the Dow Jones News/Retrieval service — part of Dow Jones & Co. — will enable users to perform searches in plain English for information contained in the on-line business information service. Dowpoint can scan more than 150,000 articles from a collection of 185 business publications.

### Apple reclaims Sun VP

At least one person who possibly should know seems to believe that there is more accounting for Apple Computer, Inc. than for Sun Microsystems, Inc. Sun Vice-President of Finance and Chief Financial Officer Joseph Granatino abruptly resigned last week from both offices to return to the halls of former employer Apple as senior vice-president and chief financial officer. Granatino, a veteran certified public accountant who filled the position of treasurer at Reim Corp. prior to first climbing on board Apple in 1981, replaces Deborah A. Coleman, who is on medical leave.

### Candle lights up data center

Candle Corp. last week announced Onscreen, a data-center management system that handles MVS, IMS, DB2 and CICS sessions on one console screen. Candle President Aubrey Chernick said the new product will help data centers improve productivity, lower costs and maintain service levels to end users. Pricing is about \$100,000 for a high-end system at a new site, Candle said. Users of Candle's Onscreen software would pay approximately \$25,000 for an upgrade.

### Lotus offers deal

Lotus Development Corp. is both priming the pump for 1-2-3 Release 3 and streamlining the interoperability of its product line with its 1-2-3 Perfect Fit offer. The offer, announced last week, gives customers of Release 3, expected to ship this week, and Release 2.5, expected in the third quarter, a \$100 rebate if they also buy Freedom 3.0 or Manicomist. These products share data effectively and can establish live links between applications.

### Lotus presses suit

There was a hearing in Boston last week concerning Lotus' suit against Paperback Software International for copyright infringement. The judge ruled that the case will be dealt with very carefully and will be broken down into its many constituent parts. This might take a bit longer, but in the end we may have a clearer view of what is protectable and what is not.

### East to meet West

British Telecommunications PLC said recently that it and six other firms from various countries have joined the Soviet Union in a feasibility study to build a trans-Soviet fiber-optic communications link connecting Europe and Japan.

## Next, Canon test Asian waters

BY J. A. SAVAGE  
CW STAFF

FREMONT, Calif. — Claiming moral high ground with his contribution to leveraging the balance of U.S. trade with Japan, Next, Inc. President Steve Jobs said last week that the firm will distribute all-U.S.-made workstations to Asia through Tokyo-based Canon, Inc.

In return for a "monoculture" distribution relationship whereby Canon will carry on other Unix workstations, Canon is contributing \$100 million to Next's coffers, amounting to a 16.6% share of Next.

Canon reported \$8.8 billion in revenue last year and claims to be the second largest workstation, personal computer and office automation organization throughout Japan, next to NEC Corp.

Next's workstation is slated to be available in quantity to the U.S. commercial market through Businessland, Inc. this fall. This delivery date is ahead of the original schedule, according to Jobs.

While not supplying any numbers, Jobs said, "Some systems are moving out to corporate America. Businessland is selling every one they can get their hands on."

Jobs said that the money from Canon's investment is not immediately necessary for operations because the company has plenty in the bank from the deals it has made with IBM. Instead, Next will "ease concerns people have about long-term stability at world-class levels."

"It's not only the cash; it's the synergy between Canon and

Next," said Infocorp analyst Peter Teige, referring to Canon's prior technology arrangements with Next.

Canon technology is in the workstation's printer and optical storage disk.

"Canon, as part of the company, adds to that feeling of stability and permanence; it gets them down the road of not just being a start-up," Teige said.

Canon, which also distributes Apple Computer, Inc. products, said it does not see a conflict between the two companies.

"We don't see any competition. Next's product is in a field different from Apple's," said Hiroshi Tanaka, senior managing and representative director at Canon's business machines sector, through an interpreter.

## Oracle plugs Unix gap

BY MITCH BETTS  
CW STAFF

BALTIMORE — Oracle Corp., noting that user acceptance of Digital Equipment Corp.'s Decstation 3100 has been hampered by the lack of available software, said that its Enging relational database management system is now available for the Unix workstation.

The announcement was made June 14 at the Users' Technical Conference and Exhibition held here, six months after DEC unveiled its desktop computer

[CW, Jan. 16].

Oracle, based in Belmont, Calif., said that Oracle Version 6.0 is one of the first major software product releases for the Decstation 3100, a reduced instruction set computing (RISC) workstation that runs DEC's Unix operating system.

At the show, DEC announced that it has developed a new version of the Unix kernel that is said to boost the performance of DEC's RISC-based computers, particularly for time-sharing, server and I/O-intensive applications.

The new kernel was released as Ultrix-32 Version 3.1 and Ultrix Workstation Software Version 2.1.

Also at the show, AT&T said a new, fully documented version of the object-oriented C++ programming language — AT&T C++ Language System, Release 2.0 — will be available by the end of this month.

Also, AT&T and Sun Microsystems, Inc. announced an agreement concerning the Open Look graphical user interface, AT&T and Sun will each incorporate the new Open Look interface tool kits into their source code products, providing developers with a choice of tool kits.

## 486

FROM PAGE 1

garnered 37.8% of units shipped for 37.9% of 386 PC market revenues.

Last month, Compaq widened the technological gap and shot past IBM by rolling out its 33-MHz 80386-based systems, which can reportedly achieve up to 8 VAX million instructions per second (MIPS) of computing power.

By comparison, an i486 is expected to offer performance comparable to 15 VAX MIPS, providing raw horsepower comparable to superminicomputers and low-end minisystems when running at 25 MHz. At Comdex/Spring '89 in April, IBM demonstrated the 25-MHz i486 housed in a demonstration version of a PS/2 Model 70 A21 that flashed complex images such as Impressionist paintings on a terminal screen with crystal-clear resolution.

Sources said Tuesday's offering will include only the add-in

1486 daughterboard, which plugs into the system's main board. Other IBM PS/2 system CPUs are directly mounted to the planar board. The 1486 daughterboard will replace the 386 memory cache controller, the 386 processor and a 387 math coprocessor, according to an IBM source.

The i486 is crucial to IBM because it gives users workstation performance on their PS/2s, as well as running software developed for IBM Personal Computers XTs and ATs and PS/2s but much faster than it runs on the 8086, 80286 and 80386 CPUs. The most striking difference between the i486 and the 386 is that the i486 contains a built-in math processor and memory cache controller for frequently occurring instructions, much like reduced instruction set computing technology. This design allows the i486 to run 2½ to three times faster than the 386, and three to four times faster on floating-point operations, according to Intel officials.

Entry Systems Division Pres-

ident James Cannarino indicated at Comdex/Spring '89, that IBM would be shipping systems and bus masters based on the i486 by the first quarter of 1990. An Intel spokeswoman said the i486 is on schedule and will be available for demonstration models in the third quarter and in volume production in the fourth quarter of 1989.

IBM has not yet scheduled an introduction of systems based on the 33-MHz 386 processor, a knowledgeable source told *Computerworld*. Other sources said IBM intends to bypass the 33-MHz 386 processor completely, as its PS/2s are fine-tuned to run at 25 MHz. Initial prices for i486-based systems are expected to fall in the \$9,000 to \$20,000 range, according to International Data Corp., a Framingham, Mass.-based market research group. IDC said the i486, when supporting users in true multitasking, multitasking environment such as local-area network servers, will allow sites to bring their computing costs down to \$2,000 per user.

# SATISFACTION GUARANTEED

If you have been searching for a software company that can provide you with a wide range of software solutions, backed up by first rate support, we invite you to join the over 6,500 MVS, DOS and VM users who have found long term software satisfaction with SEA. Since 1982, we have been developing products based on your input and backing these products with support you can count on 7 days-a-week, 24 hours-a-day. The results have been impressive for both us and our users. With products licensed at one in every four mainframe sites worldwide, SEA software has set new standards for efficiency and performance. Our over 6,500 licensed users include 9 of the Fortune 10, 85% of the Fortune 500 and thousands of other installations of all sizes and configurations. An equally important factor in measuring our success is our high level of user satisfaction, in which we take great pride.

## SEA PRODUCT GROUPS

### Operations Automation Group

SEA provides a complete line of operations automation products covering all critical areas. We are the only company that provides such a complete line of operations automation software, backed up by first rate technical support. With over 2,500 users choosing SEA as their single source for operations automation software, we have assumed a position of leadership in the field. Many users tell us the reason they have selected our products is superior support, as well as our integrated approach to long term product development.

**ODDS** - Master Console Management.

**SAVRS** - Sysout, Syslog and JCL Management, Viewing, Archival and Retrieval.

**TRMS** - Report Management and Distribution.

**CSAR** - Automated Job Scheduling MVS-DOS-VM.

**TRAMS** - Data Transmission Management System.

**QUICK** - Data Compression/Decompression for increased TRANS data transmission between mainframes or mainframes and PC networks.

**SYNTHETIC** - Functionally verifies operating system and JOBSTREAM hardware changes before production implementation.

**KEYS** - A keyword assisted search program for software and hardware inventory management.

### Application Development Group

SEA's application development products, used at over one thousand locations, have helped increase programmer and program productivity. They aid in application development for CICS, database systems and monitor program performance and operational dependencies.

**PRO-2** - Application Development MVS-DOS.

**PROFILE** - Performance Measurement and Analysis.

### DASD/Data Management Group

SEA's DASD/Data management tools have become corporate standards, used in one out of every five MVS data centers worldwide. Our DASD management products provide dramatic savings under virtually any configuration and have set a new standard for efficiency and high performance.

*We take very seriously our claim of being able to significantly decrease DASD expenditures in any MVS configuration. Our unique approach enables us to guarantee you significant savings in both short and long-term DASD cost. Take the opportunity to trial our products with no obligation and we will provide you with the same guaranteed results achieved by over 4500 users, regardless of your installation's size or configuration.*

**PDSFAST** - High speed DASD Management, PDG Management, 100% IEBCOPY replacement.

**FASTGENR** - High speed replacement for IEBGENER.

**PDSUPDTE** - High speed global JCL/PDS editor.

### VSAM Group

On the average, VSAM consumes over one-third of all DASD and greatly impacts performance at many installations. SEA's VSAM products have helped many users reduce VSAM space requirements by over 25% while greatly increasing VSAM performance.

**VCF/L** - ListC replacement, VSAM tracking and reporting.

**VCF/M** - Automated VSAM optimization and allocation.

**VCF/D** - VSAM data manipulation.

**SEA also offers a complete line of products for the DEC/VAX environment including DBMS/4th GL and output queue optimization.**

SEA has products that will save budget dollars and increase efficiency, whatever your installation's size or configuration. No other software company even comes close to matching our combination of a comprehensive line of high quality software solutions, backed up by the highest levels of technical support. We invite you to join the thousands of installations who have found long term software satisfaction with SEA products.

**For further information regarding any of the above call 1-800-272-7322.**

## DEC, HP team up with plan to extend Apollo technology

BY ELIZABETH HOKWITT  
OF STAFF

BALTIMORE — Digital Equipment Corp. and Hewlett-Packard Co.'s Apollo division announced plans last week to develop a more robust, system-independent version of Apollo's Remote Procedure Call (RPC), which they then plan to implement on their own systems and propose as an Open Software Foundation (OSF) standard.

The two vendors announced the following planned enhancements for RPC, currently by part of Apollo's Network Control System (NCS):

- Support for wide-area networks. The current RPC was designed for local-area networks and cannot make connections over to a remote link, said Gail Daniels, DEC's director of LAN marketing.
- The ability to handle larger, more complex data processing applications. The current RPC can only handle a limited

number of "arguments," or instructions for which data elements to access, according to Apollo senior product manager Saul Marcus.

- The ability to manage network and system failures. The enhanced RPC will be able to support server recovery and client rebuilding after a crash, for example, Daniels said.

The University of Iowa's College of Engineering, which currently uses Apollo's NCS, is interested in all of the RPC enhancements, according to Director of Operations Douglas Eloff. The college would like to use RPCs to access supercomputers over Internet, the research network that is due to migrate to Open Systems Interconnect protocols over time, Eloff said.

The enhanced RPC will also address NCS' inability to let an initiating program know that a failure has occurred, a critical feature for transaction processing "when we're collecting data back from several sites," he added.

A more robust RPC is just what DEC needs to support distributed applications on its VMS systems, as well as on the Network Application Support system it co-announced more than a year ago with Apple Computer, Inc., said Peter Schay, program director of small computer systems at Stamford, Conn.-based consultancy Gartner Group, Inc. If DEC and Apollo's RPC is accepted by OSF, it should make that organization's Unix platform more commercially viable, he added.

DEC and Apollo plan to implement the enhanced RPC on their network and operating systems (both Ultrix and VMS for DEC) during the next year. They will also provide support for OSI transport protocols.

HP's acquisition of Apollo will not interfere with the two vendors' development work or with HP's own strategy for implementing Apollo's distributed networking products, said Edward Muma, HP's general manager, Information Networks Division.

NOW THE FAST TRACK  
IS AN ECONOMY RUN.

### INTRODUCING GANDALF'S NEW 19.2 KBPS METRO MODEL.

When your run is within 200 miles (300km), why spend the money for a 19.2 Kbps long-haul modem? Gandalf's new LDM192 metro modem gets you there for much less.

Besides the low price, the LDM192 cuts operating costs too, running on 4-wire leased lines. And, it supports synchronous and asynchronous communication in point-to-

point configurations, including multiplexor backbones and Front-End Processor to Cluster Contr. for applications.

Our low cost still buys you the most advanced digital signal processing, plus auto-equalization for easy installation. A rackmount model is also available.

So speed up your metro communications while keeping

costs under control with Gandalf's new LDM192 metro modem.

## DBMS under PC spotlight

BY DOUGLAS BARNEY  
OF STAFF

NEW YORK — Host-style database management systems for personal computers will be center stage at this week's PC Expo here. Along with three other products, Oracle Corp. will announce its long-awaited OS/2 Server, based on Oracle Version 6.0, and will rally key vendors that will develop front-end products.

This cast of Oracle products is similar to the one dragged out to support other servers, including IBM's OS/2 Extended Edition and the Ashton-Tate Corp./Microsoft Corp. SQL Server. Heading the roster will be Borland International, which will demonstrate Paradox working with the Oracle server, and Lotus Development Corp., which will show off 1-2-3 Release 3.0, a spokesman said. Among the 30 or so participants will be Database International, Inc., Revelation Technologies, Inc. and Symantec Corp.

Oracle will offer four PC-based servers. It will support OS/2, Unix/386, which is available from a variety of vendors, Banyan Systems, Inc.'s Virtual Networking Software (Vines) and Novell, Inc.'s Network 386. OS/2 and Unix/386 versions should be available by this fall, the Vines version is planned for next month, and Network 386 for next year. Oracle rival Informix Software, Inc. is set to announce that its line of PC DBMS tools that take advantage of extended memory will run on MS-DOS-based networks. Informix will offer a sneak preview of its OS/2 version of Wings, an Apple Computer, Inc. Macintosh spreadsheet with impressive graphics capability.

On the hardware front, Pan Overseas Technology Corp. will release an Intel Corp. 80386-based computer with a built-in uninterruptible power supply.

# Northwestern University to start AI lab

BY ELLIS BOOKER  
OF STAFF

CHICAGO — An artificial intelligence laboratory devoted to educational applications will be created at Northwestern University here with the backing of Chicago-based Andersen Consulting, the two will announce today.

Andersen and Northwestern will unveil the Institute for Learning Sciences and will name as its first director Roger C. Schank, the former director of Yale University's Artificial Intelligence Project.

Andersen Consulting, the information technology consulting group inside Big Eight accounting organization Arthur Andersen & Co., will fund the project with at least \$2.5 million yearly for a minimum of the next five years. Andersen will also supply the Institute with 10 full-time employees.

Plans call for the lab, which will be located in the Northwestern University/Evanston Research Park in Evanston, Ill., to have a staff of 50 people next year and more than 100 by 1995.

Northwestern declined to specify the amount of its funding of the project, al-

though a university spokesman called it "substantial" and said the lab "will put Northwestern on the map in AI."

The lab will address three areas — artificial intelligence, cognitive science and education — and will produce software tools for training and teaching in both educational and commercial settings.

## Learning links

"This is an unusual attempt to link research on learning done in artificial intelligence and cognitive psychology with educational software," said George T. Shabien, managing partner of Andersen

Consulting, in a prepared statement.

For its involvement, Andersen will retain exclusive licensing rights to technology that is developed at the institute but not directly funded by another organization.

In addition to Andersen, other public and private backers for the institute's research and development efforts are being sought, according to a Northwestern University source.

In a rare, multitemporal appointment, Schank will join Northwestern as a John Evans Professor of Electrical Engineering and Computer Science but will remain in the College of Arts and Sciences and a Professor of Education and Social Policy in the School of Education and Social Policy.

## ZENITH INNOVATES AGAIN™

The world's number one family of PC compatibles\* now brings you everything you expect in a 286 desktop... except the size.

Big power in a small package. That's the idea behind the Z-286 LP. Another Zenith Data Systems innovation to fit your workload and your work space.

On the inside, the Z-286 LP is unmistakably a 286-based system — with enough "zero wait state" speed and power to handle heavy-duty word processing, large spreadsheets and huge databases. It's also compatible with literally thousands of industry standard peripherals.

For more advanced performance, the Z-286 LP easily lets you move up to MS OS/2™ applications. It's truly a desktop PC that's built for today... and tomorrow.

The Z-286 LP also features 1MB of RAM — expandable to 6MB without using an expansion slot. Plus, it comes standard with MS-DOS® And hard drive models include Microsoft® Windows.

It's on the outside, however, that the Z-286 LP offers you the biggest advantage: a dramatically smaller footprint than conventional desktops for more productive use of your desk space.

So free up your workload and your work space with Zenith's Z-286 LP. For your nearest Zenith Data Systems authorized dealer, call:

1-800-553-0350

THE QUALITY GOES IN BEFORE THE NAME GOES ON™

## European firms chisel plan for telecom unity

BY ELISABETH HORWITT  
OF STAFF

Spurred on by what they see as a lack of tangible progress toward the 1992 ideal of pan-European telecommunications services, information systems managers from 19 of the 22 European telephone companies met recently to hammer out an initial plan for accelerating that effort through cooperative systems development. The group's name is Intel '92.

"Cooperation among PTTs and telcos is a necessary component of the European single market of 1992, and Intel '92 bodes very well for cooperation," said John Spackman, MTS director of British Telecommunications PLC. "Now we [IS people] need to make a smooth link with cooperation programs on the operations side."

Last week in Versailles, the group officially released a plan for cooperative systems development in 10 major areas. The plan placed a high priority on one-stop shopping: the ability of one European carrier to supply a multinational customer's full-service needs, even when other Postal Telephone and Telegraph organizations (PTTs) are involved. Among the development areas targeted are the following:

- Support of industry standards, particularly electronic data interchange and Open Systems Interconnect (OSI) for interconnecting PTT services.
- Interadministration accounting, with a consistent billing procedure that would enable PTTs to bill for services that they did not directly provide.
- An international directory to support communications among different PTTs' users.

The group identified network management and security as tough areas to address. Cited during the meeting was a recent Coopers & Lybrand report that concluded that a satisfactory level of security in Europe would be "difficult" to achieve.

The group also concluded that because all participants have different types of network management systems, "there is no need for, or possibility of, cooperative work" except among a few PTTs.

Raymond Bouil, a Paris-based telecommunications writer, contributed to this report.

**1** HP and Oracle have joined forces to focus state of the art technology on a broad class of financial management problems, and we'd like to keep you up to date on our progress.

**2** Hewlett-Packard Company, known for outstanding product reliability, leading price/performance and top-rated customer service and support, offers you the HP 9000 Series 800. And this standards-based system can be integrated into your current environment without missing a beat.

**3** Oracle Corporation, the largest database company in the world, is offering tested, world-class financial management technology that's so easy to use, you probably won't ever read the documentation.

If you are interested in new financial management technology, HP and Oracle invite you to attend a free half-day financial management conference in a city near you. Consider it *due diligence*.

# Others talk about database speed.

Every time a DBMS company publishes an OLTP (on-line transaction processing) benchmark study that company's DBMS is fastest. Which would indicate that every DBMS is fastest. How can that be?

## A straight guarantee beats a slanted benchmark.

The fact is, a DBMS that's fast on a benchmark may not be up to speed on your application. Unless the DBMS provides tuning capabilities that allow you to fine tune your application for maximum speed.

That's where INFORMIX-TURBO shines. And that's why we can guarantee it will run your new OLTP application faster than any other UNIX® Relational DBMS. Or we'll give you your money back.

## Fine tuning makes OLTP applications fly.

Even before tuning, INFORMIX-TURBO is fast. Its optimizer automatically provides speedy access to data.

But, frankly, it's the TURBO XPT (Extended Performance Tuning) capability within INFORMIX-TURBO that enables us to offer you this guarantee. Very simply, it provides more tuning features than any other UNIX RDBMS.

Including, for instance, more locking options than any other RDBMS. You can specify granularity, severity and duration of locks, giving you total control over how each lock affects each user, as well as overall application speed. Moreover, you can tune in even more speed by adjusting the size of your

# Only Informix guarantees it.

## INFORMIX-TURBO PERFORMANCE GUARANTEE

*Informix guarantees that our INFORMIX-TURBO database engine will run your new OLTP application faster than any other RDBMS, or we'll give you your money back.\*\**

shared memory. Thereby avoiding time-consuming physical disk access.

### Performance tuning is easy with the right tools.

TURBO XPT includes a full-screen, menu-driven tool that lets you monitor application performance, locate bottlenecks, make precise adjustments and then observe the effects of your adjustments as your application runs.

What's more, we offer a special Turbo training course to help get you started. Plus all the on-going technical support you'll ever need.

### Free booklet, "How to Benchmark and Tune an OLTP Application"

For a free copy of our new guide, "How to Benchmark and Tune an OLTP Application," and our INFORMIX-TURBO Guarantee InfoPak containing the details and conditions of our INFORMIX-TURBO money-back guarantee, call or write: Informix Software, Inc., 4100 Bohannon Drive, Menlo Park, CA 94025, 1-800-331-1763, ext. 3800. In Kansas, call 913-492-3800, ext. 3800.

And stay tuned for a fast response.

# MSA announces EIS starter kit at a 'smart' price

BY ROBERT MORAN  
CIVIL ENGINEER

NEW YORK — In an effort to pump new revenue into the company, Management Science America, Inc. last week introduced a starter kit for executive information systems (EIS) that

will tie into the company's mainframe applications.

The software, called Smartview, resides on the workstation under IBM's Systems Application Architecture and offers the look and feel of IBM's Common User Access. It was designed to provide corporate executives

with information gleaned from MSA's mainframe-based general ledger, human resources and manufacturing and materials management software at a significantly lower price than other EIS strategies.

John Dunkle, vice-president of Workgroup Technologies in

Hampton, N.H., characterized Smartview as a good interim step for MSA. "It provides functionality that is not common in the market today," he said, "and MSA will do fairly well with it."

Dunkle, however, said users "aren't yet looking for that functionality" and that new competi-

tive technologies will emerge by the time the MSA product gains user acceptance.

Pete Kastner, vice-president at the Aberdeen Group, a consultancy in Boston, said, "The number of companies using executive workstations are few and far between." He added that the EIS products are waiting for a market to catch up to them.

Smartview, however, is not a plug-and-play alternative. Like other EIS systems, it requires time and planning expertise, analogous to building an expert system. Nevertheless, while EIS systems can cost as much as \$1 million to implement fully, the MSA alternative can start at approximately \$100,000, which includes the cost of software and consulting services required to build the EIS applications.

The first application, general ledger, is scheduled for delivery in the fourth quarter of this year. MSA claimed that the human resources, manufacturing and materials management software will be available sometime next year. Each will cost \$50,000, the company said.

## Call it robust

Smartview is part of a joint agreement between MSA and Comshare, Inc. in Ann Arbor, Mich., the developer of the Commander EIS, which is a more robust system that extracts information from almost all databases residing on IBM mainframes. Comshare will share installation responsibilities with MSA.

"Smartview offers a big chunk of Commander functions for \$50,000," said Richard Crandall, president of Comshare, Inc. "While it is limited, you can definitely get going, and we are going to find out what a \$50,000 EIS means out there."

However, Crandall estimated that about 35% of Comshare's customers are already MSA customers. One of the 35%, an assistant vice-president in charge of IS for a large East Coast firm who requested anonymity, said, "There are positive sides to the announcement for certain companies that don't have a substantial budget or the technological expertise to match and marry both products." The executive said the return on investment is not easy to assess, but his own implementation, which accesses MSA software and numerous other data, paid for itself in about three years.

Smartview will carry two of the most important Commander applications: an electronic briefing book and the ability to dynamically browse through information using such tools as the touch screen and mouse. The full Commander workstation, which costs roughly \$170,000, not including consulting to build the EIS, can access news wires and such public data sources as the Dow Jones stock reports.

## When it comes to mergers, acquisitions and corporate restructuring, Software 2000 lets you play hardball.

The name of the game in corporate America today is change. Companies are constantly reinventing themselves... merging, acquiring, reorganizing and restructuring. Key to being a winning player in this environment is management's ability to respond quickly and dynamically to ever-changing game conditions. To gain that winning edge, more and more U.S. corporations are teaming up with Software 2000.

### Loading the bases

Software 2000 develops and markets financial and human resources software for the IBM AS/400 midrange computer. Our all-star product lineup includes General Ledger, Accounts Payable, Accounts Receivable, Fixed Assets, Payroll, Personnel, Flexible Benefits and Industrial Health.

All products are SAA compliant, presented to you through Application Manager 2000, our common user interface. The result is a single learning curve for all your users: maximum productivity in a minimum amount of time.

### A winning team

Combining mainframe power with PC ease-of-use, Software 2000 products are at work in major corporations worldwide, and in all industries including: manufacturing, communications, healthcare, hospitality, transportation, banking, and insurance. Put our winning team on your side. Find out how Software 2000 can help you play hardball.

Call (800) 525-0490 Ext. 2071.

# Corporate users eyed closely for piracy

BY ROBERT MORAN  
CIVILIAN

The Software Publishers Association (SPA) announced last week that it has settled out of court a copyright infringement suit against Facts On File, Inc., a book publisher in New York. The association said it will now broaden the scope of investigations to bring suits against corporate users.

Howard Epstein, president of Facts On File, said the company paid more than \$100,000 as a settlement for loading illegal software on the hard disks of some of its office personal computers. The payment includes the cost of attorneys' fees and that of obtaining legal copies of the plaintiff's software.

The plaintiffs represented by SPA, an

industry association, included Ashton-Tate Corp., Lotus Development Corp., Microsoft Corp., Wordstar International—formerly Micropro International Corp.—and Wordperfect Corp.

Neither SPA nor Facts On File would discuss how the infringements were discovered, and both claimed that the case was closed. "We've been remiss, made amends and put this behind us," Epstein said.

SPA also announced that it settled out of court a suit filed in April against Cavalier Office Products/Today's Business Computer Center (TBCC), a computer

dealer in New York.

The suit charged that TBCC illegally loaded software on hard disks. It was filed on behalf of Ashton-Tate, Lotus, Microsoft and Wordperfect.

The suit was settled out of court and includes a \$25,000 payment to SPA and a permanent injunction prohibiting TBCC from infringing on any of the copyrights of the plaintiffs.

The announcement leaves five of 18 cases still pending: The 13 settled so far did not go to trial. However, the first case, filed in March 1988 against The Clone Store, a computer dealer in San Leandro,

Calif., is still pending.

According to SPA, computer dealers are the biggest culprits, but SPA Executive Director Ken Wasch said the association will now ferret out illegal usages among corporate users.

Epstein acknowledged that his software use got out of hand and said that companies ought to monitor software usage more closely. Although companies can establish firm policy, they cannot control the software used by employees, he said. "We shouldn't have to watch these people," he said.

According to Wasch, the companies may not have to. Consultants, software developers and the all-but-legend disgruntled employee will do it for them—and already have.

## Fresh Clipper reduces time, ups memory

BY PATRICK WALURZYMIAK  
CIVILIAN

LOS ANGELES — Nantucket Corp. updated its Clipper application development system last week with the release of Clipper 5.0. The firm also previewed its next-generation technology by demonstrating an object-oriented programming system that is portable across multiple platforms.

Nantucket's newest version of Clipper, originally introduced in 1985 as a compiler for Ashton-Tate Corp.'s dBase, allows programmers to reduce development time and work around the MS-DOS barrier of 640K bytes of available memory.

"Corporations have moved mission-critical applications to PCs, placing great demands on developers to make programs fit within DOS memory constraints," said Larry Heimsdinger, Nantucket's president and chief operating officer. Heimsdinger addressed nearly 1,000 Clipper developers attending the firm's developer conference here.

### Responsibility diminished

The Clipper upgrade, which replaces Version 4.0, offers programmers the ability to develop large applications programs without building overlays, the company said. With Version 5.0, a new link automatically handles the allocation of the program in memory, completely removing that responsibility from the programmer.

The updated Clipper package is priced at \$795, a \$100 increase over the previous version. Nantucket plans to ship the update Sept. 15 at a price of \$195 to owners of any Clipper version.

The next-generation object-oriented programming system also offers version-independent SQL support.

During the demonstration, Nantucket showed multipatform support with one source-code program running unchanged on DOS, IBM and Microsoft Corp.'s OS/2 Presentation Manager and Apple Computer, Inc. Macintosh platforms.

# A Strong CASE for Choosing Pilot Over Comshare.

**PILOT ANNOUNCES  
INDUSTRY FIRST**  
Advanced EIS Code Generators

BOSTON—Pilot Executive Software, Inc., pioneers of Executive Information Systems, recently introduced...

Innovation has made us a strong competitor. We developed the first commercial Executive Information System in 1984. We pioneered cooperative processing architectures, time-series relational databases, dynamic menuing and packaged EIS applications.

Now we're introducing our new line of EIS/G code generators that eliminate up to 80% of the development and support costs of an EIS—the first application of back-end CASE tools in the EIS industry.

This innovation lets you generate executive applications faster and with better code integrity than any system the competition can provide.

Leadership. There's an old New England saying: "The empty wagon rumbles the loudest."

Real leadership is not won by words or claims. It's built on references.

Real corporations using real systems.

Ask for our complete user list. Then ask Comshare for their list of "10,000 EIS users."

If you want to see more, sign up for one of our hands-on workshops. You'll be able to build your own CASE for choosing Pilot.

For more information, call (617) 350-7035.

Or complete and mail the coupon below to: Pilot Executive Software, 40 Broad Street, Boston, MA 02109.

### Put me on the CASE...

- ☐ Call me to arrange an on-site demonstration or hands-on workshop.  
☐ Please send me copies of the reports "EIS from the MIS Perspective" and "EIS: The Management Perspective".  
☐ Send me a schedule of seminars in my area.

## EDITORIAL

## Foreign aid

**T**HROUGHOUT MOST OF this century, the British were world-renowned for their research and theoretical development, particularly in the areas of math and applied physics.

But for a variety of reasons, other developed nations took greater advantage of this basic work than the Brits did. Perhaps this is why the economies of the U.S., Japan and West Germany flourished after World War II while the UK economy languished.

Is the same thing happening to the U.S. today? Are we leading the R&D effort, but to the greater benefit of foreign economic competitors, particularly the Japanese?

That is the implication coming from a U.S. House subcommittee chaired by Rep. Ted Weiss (D-N.Y.). Last week, Weiss' subcommittee spent several hours grilling the president of MIT, charging the school with selling technology — paid for with federal funds — to foreign nations.

Specifically, the government attacked MIT's industrial liaison program, which charges domestic and foreign companies nominal fees to freely access the fruits of the school's high-tech research. This research is largely conducted with federal money. More than half of these companies are foreign, and 57 are Japanese.

The MIT-Japan connection is also seen in the school's vantaged Media Lab. The Japanese provided most of the money to build and endow the Lab (CW, June 12), and of the 15 companies with researchers at the Lab, 12 are from Japan.

With a backdrop of a stupendous U.S. trade deficit and the continuing exodus of industrial leadership in key industries from the U.S. to Japan, the prospect of U.S. tax dollars actually priming the pump of economic calamity is apparently too much for Weiss and his subcommittee.

For their part, MIT officials and other national science policy leaders contend that the U.S. can get back at least as much as it ships abroad in terms of high-tech R&D. But is that really the case?

The answer is no. While the U.S. system of public education is in a pronounced period of decline relative to other developed countries, our university system as a whole is second to none. While congressional saber rattling may encourage more two-way flow of information and research, there simply is more of this information at our end of the pipeline.

Is this cause for alarm or at least for greater scrutiny of government-funded university research? To a certain extent, yes. Government-sponsored research is a cornerstone of long-term economic progress, and the chief benefits of that research ought to be U.S. companies.

In the longer term, however, there is no getting around the fact that the growing commercialization within major universities means that research is available to the highest bidders. Whether the list of bidders is restricted because a financial, moral and ethical issue that only the universities can address.

## LETTERS TO THE EDITOR

## Officevision-ary

I take issue with two of the points mentioned in "Officevision plan hinges on LANs" (CW, May 22).

On a purely cost-effectiveness basis I don't see the demise of the 3270 terminal soon. Why would a business use a \$4,000 local-area network-connected personal computer to do data entry or answer questions when you can use a \$400 3270 terminal? The point is, a cost-effective configuration is designed based on what the applications command. The "analysts" making this prediction are probably the same ones predicting the year of the LAN. They neither have to pay for it nor support it.

Second, the Intel Corp. 80286 processor is not limited to 640K bytes of memory. It is limited by the operating system, for which OS/2 is a solution. Further, the 80286 has plenty of power for most applications today, and the IBM PC AT bus is far from dead: it is probably just hitting its stride and at extremely cost-effective pricing.

Officevision appears to be a solid direction, and I am sure IBM expects that it will be the value-added product that users will buy into to move to OS/2 and host-connected Token-Ring LANs. High cost and a scarcity of applications are well-publicized reasons for current resistance to OS/2.

Add to that the additional costs associated with Officevision, including all of the support and management issues it imposes on an organization, and I see a tremendous cost benefit barrier to hurdle. Seamless operation is a potentially productive marriage between microcomputers and larger host

machines, but at what cost? With so many data processing shops under the gun to justify what they are doing now, I can't imagine them taking on this burden any time soon.

Peter Ormichen  
State DP Specialist  
Madison, Wis.

## Price and honor

Patricia Keefe calls on vendors to "Prune the mumbo jumbo" (CW, May 8) and say what they mean. As an example, Keefe uses Wordtech's \$50 price hike of DBXL in conjunction with Release 1.3, a major upgrade. Keefe says we had a good deal of "chatter" to state in the headline of our press release that DBXL's price hike was "in honor of a major upgrade." If Ms. Keefe said this in a positive way, we thank her.

If she meant it negatively, we offer the following: Vendors significantly adding to the value of a product are justified in raising the price of that product. Wordtech feels it has significantly added to the value of DBXL.

According to Webster's dictionary, one of the meanings of the word "honor" is to give recognition. Therefore, what's wrong with telling the world we've raised the price of DBXL in recognition of adding significant value to DBXL?

Daniel C. Berkovits  
Manager  
Corporate Communications  
Wordtech Systems, Inc.  
Orinda, Calif.

## Look carefully

I am writing in response to the letter from Mr. Don Merz entitled "286 half-life" (CW, April 17). Selecting a minicomputer to

purchase based on the processor chip as the primary criteria is analogous to choosing an automobile by looking only at the engine.

There are many factors that go into the selection process. The processor chip is but one, and in my opinion not the primary criteria. Many users do not now, nor will they ever, require the power of an Intel Corp. 80386 chip. By the time mass-market user-friendly software is available, we will be talking about the 80586 chip!

Before thinking about the processor chip, first determine your needs in terms of applications and available packages. Then and only then can you estimate the required processing power. Once the power estimate is known, an intelligent survey of available systems can be undertaken. I would not hesitate to purchase a solid, reliable, Intel 80286-based system with a proven history over a poorly constructed 80386 microcomputer.

Let's try to stop our blind rush to ever greater power and stop long enough to look at what is really needed. Let's look for user-friendly and user-usable software. The user doesn't care what chip is inside the computer. He cares whether the system can do what he needs.

Eve Fickelthal

# Focus on product marketing

RICK BLUM

Selling computers is easy — easy, that is, when the economy is booming and empire-building MIS managers can justify the cost of almost any purchase.

However, in the face of an economic slowdown and growing scrutiny of capital expenditures by financial overseers, computer companies have found it increasingly difficult to maintain traditional revenue growth. This trend is particularly true for companies selling into established markets.

Even in the hot workstation market, immunity from red ink is not assured. Witness Apollo's recent financial setbacks, which resulted in Hewlett-Packard's successful buyout of the struggling workstation pioneer. What happened to these companies? Why have they not been able to stem the slide? A clue can be found on the organizational chart. See where product marketing fits.

The computer industry blossomed in the 1970s on the back of technological innovation. Engineering geniuses in the lab kept cranking out powerful new products that precisely sold themselves to users who hungered for ways to automate everything from payroll to design.

As the industry matured, the same engineering geniuses began looking at the competition. This shift in focus led to a slowdown in innovation as engineers turned from the conception of

new and wondrous creations, to the development of machines that matched the competition. Throughout all this, product marketing performed its traditional function in high-tech companies: make and say Yes.

Some people will tell you that the role of product marketing in technology-driven industries is to take the products that engineering develops and find ways to sell them. (Don't scold. I was told to do exactly that by my boss when I was a product manager.)

Others contend that product marketing's role is to find out what it is that customers want and then direct engineering in the development of these products. Both of these views are correct to a degree, but they both miss an important point: Product marketing can't perform either role if it doesn't have the power to implement its ideas.

I worked for a major minicomputer company for five years. During that time, product marketing was alternately an independent entity reporting to the president, a department in the research and development organization, divided among various business groups, reunited under R&D again, split between R&D and sales and, finally, reunited as an independent entity. All of this occurred under a CEO who was reputed to be supportive of marketing's role, having come from that bastion of marketing know-how, IBM.

This CEO had recruited former colleagues to head R&D and sales. The vice-president of marketing, however, was always an internal appointment. Not surprisingly, none of the four who headed marketing during those years had the stature to change

product and selling strategies already embedded in the engineering and sales organizations. The irony is that this firm is always identified in the press as "marketing-driven."

Of course, changes in product development were eventually made; they were always the top-down "if we capture only 2% of the market we'll be OK" approach. Is it any wonder that redirection of the firm's resources toward emerging markets was a case of too little, too late? Is it any wonder that this firm is now facing a severe financial crisis?

If you took a survey of product managers working for established computer companies and asked them how they felt about their job, three out of four would probably answer "frustrated." Most had joined marketing with the intention of formulating and implementing long- and short-range product strategies that would meet customer needs and wants.

What these product managers usually found was that, regardless of the soundness of these strategies, their ability to influence engineering and sales was minimal. For the axiom of high-tech decision making is that when push comes to shove, "Go with what got you there."

After all, the thinking goes, without engineering we would not have products to sell, and

without sales we could not pay anyone's salary.

And so things went along smoothly for a while for many of these firms — engineering developed whatever was most familiar (or most fun to work on), sales sold to whomever was willing to buy at whatever necessary price, and all the while marketing led the cheering section — until one day someone noticed

IBM DATA

that revenue growth was declining, as one new product after another had been greeted by users with a big yawn. That someone was usually Wall Street, and when Wall Street notices, cutbacks begin.

The recent setbacks computer firms have suffered can be attributed in part to their failure to make organizational adjustments that reflect their metamorphosis from small start-up to Fortune 500 status. It's fine for a start-up to be driven at first by technology, and later by aggressive sales campaigns, but eventually, if successful in capturing a significant market share, a market-driven perspective is crucial for continued growth.

Marketing must be seen as one of the pillars (along with engineering, customer service and manufacturing) upon which the company is built. This means that the vice-president of marketing must report directly to the president or CEO, on equal footing with the vice-president of engineering. Product planning should be formulated within marketing, not within engineering.

ing. Likewise, sales should be an organization within marketing and not a separate entity.

The effect of these organizational changes is to focus plans for future products on the customers' needs, not on technology.

For those high-tech companies that have failed to keep up with the market, it may be too late to effect the necessary organizational changes to get back in the game, as companies such as Honeywell have found out. New high-fliers should be alert to the hazards of growth and plan now to assure their organizations as they gain market share, otherwise the fate of their progenitors may await them, too.

## IS execs should be aware of limitations

IBM WATCH

MICHAEL KILLEN

As IS managers ask for assistance in preparing for the business needs of the 1990s, IBM is answering with its version of the future.

IBM's recent introduction of OfficeVision and its continued advancement of Systems Application Architecture (SAA) indicate

that the company recognizes these new IS requirements.

However, these moves also reveal that IS managers who embrace IBM's solutions will have their work cut out for them in addressing areas that the vendor's strategy will not cover.

While SAA provides the framework for the future business infrastructure that managers will require, it is a narrowly defined framework.

SAA encompasses three proprietary hardware families, four operating systems and many software-to-software interfaces. But it is so thoroughly traditional IBM that the firm has not even included its own recently promoted AIX operating system, a

version of which will be offered to customers by other computer suppliers that are members of the Open Software Foundation.

IBM's answer to IS' future requirements excludes many existing IBM products. For example, the PC, System/36 and System/38 have been omitted because they lack the functionality for sophisticated growth.

### Missing factors

The company has also excluded products that do not have good return potential such as the 370/DPX, which is an important bridge system to the 370 for 8100 customers.

Essentially, IBM is saying it will solve the systems integration problems that must be solved to build the IS infrastructure. But it will limit the integration to its own main line products. IS will have to integrate non-IBM computer systems, and other vendors will have to be

SAA-compliant to participate under the framework.

IS managers can expect the IBM sales force to offer products that they are most familiar with — ones that meet their own business needs and interests — and that may not always be best for the user.

For example, because of the great momentum within IBM to sell products based on the system 370-architecture products to large firms, IBM will probably continue to promote the development of the SAA infrastructure on two-tiered, 370 intelligent workstations (IWS)-based systems instead of three-tiered, 370/AS/400/IWS systems.

If IS managers implement image processing, which is best accomplished by locating a server between the mainframe and IWS, IBM may change its two-tier stance. Another factor that runs counter to IBM's strategy is the higher costs (including

overhead) of the 370 vs. Application System/400 solution.

If IS managers wish to include advanced office automation in future systems plans, they should recognize two significant parallel media shifts: from paper to electronic media and, within electronic media, a shift from magnetic to optical media.

As a result, IS professionals will recognize that IBM has been heavily committed to large-scale magnetic storage; optical storage presents a significant potential threat to IBM's revenue, and the vendor is unlikely to strongly encourage this shift.

In short, IS managers should recognize SAA's limits, including the idea that IBM has products that functionally and business-wise do not fit the SAA structure. They should continue to make their needs known to IBM, but plan for the realities that IBM's product announcements make apparent.

Killen is president of Killen & Associates, Inc. in Palo Alto, Calif. He is also author of the book *IBM: The Making of the Computer View*.

## Business needs to take advantage of changing market needs.

Directions in hardware technology have a habit of changing with every product release, trade fair or DP cover story. That's one reason why your organization should profit from the benefits of powerful, portable system software technology designed to take advantage of change. Without jeopardizing investments in already acquired applications or hardware.

ISA - The open Integrated Software Architecture - from Software AG is just what you need to be your best. The comprehensive products it supports are portable. Even across hardware systems (IBM, DEC, Siemens and WANG).

They're open. Ready to adopt new ideas and technologies, without disrupting performance. They're fully integrated. And they're powerful, capable of providing the fast, effective solu-

tions required in today's high-volume, multi-computer environments.

With ISA, all you need to integrate 4th generation applications, true end-user computing, relational-oriented data management, a universal office system and the transparent distribution of data and processes is at your command.

And, with more than 80 offices in over 55 countries, Software AG not only provides outstanding products. It provides outstanding service. Call toll-free for more information: 1-800-843-9534 (In Virginia or Canada call 703-860-5050).

## SOFT TALK

Stanley Gibson

### Cultivating software

Just as early man discovered some plants were good to eat and then began cultivating them, so IBM, having noted the benefits that "wild" software companies can offer, now seeks to domesticate them. Software vendors are facing key decisions in their evolution. Do they accept IBM's efforts at cultivation and possibly lose their ability to live in the wild, or do they remain in the wild and possibly die? Most vendors are choosing to work with IBM.

IBM is thus becoming a sort of software gardener. Those firms that appear helpful are being fertilized and watered—perhaps even talked to, as plant enthusiasts sometimes do. In contrast, those software firms that IBM does not see as being benign are being weeded out.

A recent example of IBM's giving a treasured specimen an infusion of nutrients is its purchase of a 5% interest in Management Science America. That was just the most notable of a string of investments by IBM. One software vendor re-

## Massive indecision

Will parallel units ever find a place in the sun?

### ANALYSIS

BY JAMES DALY  
C.W. STAFF

1986: The year in which massively parallel computers will take the industry by storm.

No? Then how about 1987: The year of the highly parallel systems.

Or 1988: Users of parallel computers unite.

Come on, once more with feeling. 1989: The year massively parallel systems will come on like gangbusters. Well, at least the year is not over yet.

The anticipated embrace of massively parallel systems has been as difficult to ascertain as who is in charge in China. While these machines certainly got a big boost in mid-May when Thinking Machines Corp. introduced two more machines that utilize up to 64,000 processors [C.W. May 22], it is still anyone's guess when—and if—they will

be either the next device to push the envelope of supercomputing or become the Mood Ring of the 1990s.

While the future of parallel machines may be uncertain, no one questions their basic premise. Massively parallel systems work like a beehive. None of the members are very bright or strong individually, but when they are joined together with a unifying task, incredible jobs can be done at lightning speeds.

On parallel systems, data elements do not have to be brought to a central processor to be added or subtracted. Instead, hundreds—sometimes thousands—of microprocessors slice a problem and have each processor work on a small chunk at a time.

Because traditional supercomputers are inherently limited in how fast they can get data from memory, parallel machines—which position memory with each microprocessor—may be-

### Parallel tracks

All types of parallel processors are expected to stay on steady growth tracks through 1991.

C.W. STAFF PREPARED BY JAMES DALY

come a better-performing alternative, often matching the speed of supercomputers at a fraction of the cost.

While it all looks good on paper, the road to a utopia of parallel computing is littered with the carcasses of companies that could not make their ideas fly: Chopp Computer Corp., Culler Scientific and Well's Other Computer, as well as Genetec.

Why? Parallel processing machines have run into a wall of problems that stem from the way they handle their problems, which is far different from the traditional uniprocessor world.

The greatest of these is software. While it is relatively easy to glue thousands of processors together, makers of parallel systems are finding that it is another

## IBM dangles SMS migration aid

BY ROSEMARY HAMILTON  
C.W. STAFF

IBM hatched a plan earlier this month to take users by the hand and guide them to its System Managed Storage (SMS) concept.

The Custom Migration Support for the Data Facility Storage—Management Subsystem (DFSMS) was designed to assist users in tailoring their data for SMS.

The announcement came a few weeks before IBM's scheduled release of a small piece of code that, in effect, acts as a switch to turn on SMS.

At the very least, the migration service will cost \$80,000, but it is anticipated that the SMS migration time will be cut in half, according to IBM.

**Automatic data allocation**  
The SMS concept involves hardware, software and procedures that will create an environment in which the system automatically allocates data to various storage elements.

The data is assigned according to its importance and frequency of use. Before that can happen, however, users are forced to structure their data according to a storage hierarchy

that prioritizes it. The SMS software will then maintain that structure.

SMS requires plenty of up-front planning because users need to change their perception of storage. In addition, data sets, or files, have to be clearly named and cataloged, a procedure that some users have grown lax about over the years, according to IBM.

#### A little housecleaning

As a result, many users will be required to redo these procedures for the data sets to participate in SMS.

With the migration service,

IBM representatives will analyze a customer's data sets and then be able to determine a priority list for the data.

IBM then supplies the customers with a model that tells them what data should go where in their storage setup.

The concept calls for placing data by priority, with the most important data residing closest to the CPU in expanded storage or cache while the least important data can be stored out on a direct-access storage device.

The user is required to enter the model information in the DFSMS software so that it can automatically allocate data. IBM will then assist the customer in moving the first application to SMS.

## BIM Spotlight

**PROBLEMS:** The DOS/VSE Label Area is a performance bottleneck. Slow disk, relative to CPU, limits performance.

**SOLUTION:** BIM-VIO—The DOS/VSE "Virtual" Disk Drive and Resident Label Area Product.

BIM-VIO creates a "Virtual" Disk Drive in the VIO area of DOS/VSE/SP. Since this area is in virtual storage, references to it are satisfied at CPU speeds and no actual disk I/O takes place. The net result is a potentially significant performance improvement of programs using disk files that have been moved to this area.

A built-in feature of the product is that the DOS/VSE Label Area is relocated to the virtual disk. This area is one of the most frequently accessed in most DOS/VSE areas, so moving it to the virtual disk should result in significant performance improvement to the overall system, regardless of any other specific use of the virtual disk capability.

Call for full documentation or free 30-day trial. Price: \$200, \$1800yr, or \$1800mo.

BIM has over 20 years of experience in the design and use of DOS/VSE, OS, and CICS, and also performs extensive programming consulting. Marketing agents in most countries.

# Pipeline's IS group put to test

ON SITE

BY J. A. SAVAGE  
OF STAFF

ANCHORAGE, Alaska — When the Exxon Valdez tore open in Prince William Sound in March, tanker traffic in the sound had to be throttled back to keep from spreading the oil and thwarting early cleanup efforts. Not only were the tankers stalled, but because there is no storage available in Valdez, the flow of oil had to be decelerated over 800 miles of two-foot-wide pipe.

"You can't just hit a switch. You have to slowly [throttle] down each of 11 pump stations; it's a complicated process," said Mac McCoy, department manager of Alyeska Pipeline Service Co.'s systems and computers. In the vast tundra there are 11 stations for Alyeska, a consortium formed by oil companies that drill in the northernmost latitudes. Communications between

the stations and Alyeska's headquarters here pose problems. Personnel are often out of the pump station and miss phone calls, and Anchorage is one of the few places where Federal Express does not set foot.

The oil spill posed an unusual communications burden for Alyeska because the pipeline, which moves two million barrels of oil a day, is rarely shut off. Headquarters had to get word to the pump stations to take action, and the pump stations in turn had to communicate with one another. "They are so remotely located, we could spend so much time playing telephone tag," McCoy said. "The fact that we had Profits helped. We could use E-mail for communication."

Surprisingly, the voice and data lines rarely fail. That is be-

cause there are no lines, per se. Alyeska and the local telecommunications company, Alascom, Inc., built a dedicated microwave band. Since Alyeska installed Profits in 1985, the distance and harsh environment have not impeded communications.

The computer room support staff, however, has trouble keeping the air conditioners turned low enough so the computers do not freeze.

Alyeska's IBM 3081 and 3083 mainframes primarily handle materials inventory, materials movement and office automation. Movement and materials is information systems' main function in the company. Alyeska has to be able to locate equipment, such as a turbine, and handle its shipment, because there are no regular freight services along the

pipeline. "We can replace and repair [systems and equipment] within three days at every remote station," said Terry Trimble, managing of operating operations at the company. "It's a logistics problem — we only have critical spares, like modems, on hand at the pump stations — but it's handled quite well."

IS also keeps track of where the oil is and to whom it is going. That function is complicated by Alyeska's ownership. The seven oil companies all require different daily reporting forms, and Alyeska cannot let one firm know what any of the others are doing, according to McCoy.

Because it is a consortium, the pipeline has no dedicated management. All of the managers are on loan from an owner company. But McCoy swears that their individual IS styles are not foisted on Alyeska. "At times, they have tried to help us, but it turned out that nothing

they had was relevant to the pipeline," he said.

Alyeska's IS role was originally expected to decrease as the recoverable oil available from Prudhoe Bay — 9.5 billion barrels — declined. "We thought that with the decline, we would reduce activities and personnel. But there is more work now," McCoy said.

At the pipeline apex, it needs more repair and monitoring. "And then there are things like the oil spill," McCoy said. The spill and a new \$25 million construction project — replacing a worn section of pipe in a mountain pass — nudged the CPU work load to its highest point in April — 41,000 transactions per day.

As the company relies more on IS, "IS is becoming increasingly influential in the company," McCoy said, noting that Alyeska, with its growing infrastructure complex, is one of Alaska's premier IS shops.

## IBM's AS/400 bug cure seen worse than disease

BY RICHARD PASTORE  
OF STAFF

MARLBORO, Mass. — Bugs in the Application System/400 operating core are netting users, but IBM's pesticide is proving to be even more annoying, according to attendees at the Systems 32 Expo here earlier this month.

IBM's Program Temporary Fix (PTF) tapes are intended to correct AS/400 operating system errors, but users at the regional conference complained that installing PTFs is a long, te-

dious process. Furthermore, defective tapes came worse problems than ones they were intended to fix, some users said.

Douglas Prescott, president of New England Information Systems in Haverhill, Mass., said he had to shut down his business temporarily to install a series of PTFs on his Model B10. The process, which must be constantly attended by a systems operator, required 53 complicated steps.

Users with smaller businesses said they cannot afford to shut

down operations for a day every time a new PTF tape comes out — as often as every six weeks for cumulative tapes.

### Plans for cranky PTFs

Donald Friedman, IBM director of market strategy at the company's Applications Business Systems division, acknowledged that the PTFs are unwieldy and outlined plans to remedy the problem. "We've got teams working nights and days to make it easier to install fixes," Friedman said. By August, IBM plans to reduce installation steps from the typical 28 to one or two and cut down on the usual eight-hour installation time, he said.

IBM is also planning to offer users the option of applying PTFs more specifically, "so you

can fix the problem you have as opposed to all of them," Friedman said.

"There are too many [PTFs], and it takes too long," said Richard Gardner, systems manager at Horton Co., a maker of diamond grinding wheels in Worcester, Mass.

"We're on-line 24 hours a day, so we have to find a holiday and try to install the tapes all at once," said Bruno Smigajski, a programmer/analyst at American Saw & Manufacturing Co. in East Longmeadow, Mass.

Some users said that bugs in the PTF tapes introduced new problems. A PTF wreaked havoc with Smigajski's 2440 tape drive by causing it to run uncontrollably. After installing the PTF, he tried to reload the sys-

tem from backup tapes, but the drive refused to stop and accept subsequent tapes. "We're a little afraid to use [the PTFs] now," Smigajski said.

A PTF "destroyed" the Remco Job Entry facility on Prescott's machine, he said. "IBM doesn't tell you about the PTF bugs," he added. "You have to call them up. Then they say, 'Oh, there is a problem with that tape.'" IBM said Prescott another PTF to fix the first one.

An IBM spokesman said that PTF bugs "are not prevalent. The tapes go through a rigorous testing program." But he said if users did not install PTF 1.2, a cumulative tape containing enhancements that was released in November, future PTF installations "could cause problems."

For IBM 3270, S 36 38, and AS 400 Users:

## 100% IBM 4224 Compatible!

### Available Now!

With our plug-compatible IS/7224 desktop dot matrix printers, you can print everything on IBM 4224 can print, and more.

We offer 200 cps and 400 cps models. Each prints high-resolution graphics, bar codes, and overline characters with full PostScript support. Plus, our new-to-use Escape Language lets you perform

these advanced printing functions without GDDM, RGL, or other special software.

With an IS/7224, you can switch instantly from continuous forms to cut sheets, then back to continuous, without

reloading or losing the top-of-form position. You also get no-waste demand-document top-of-form without extra cost penalties. Forms can have up to six parts.

Fully upgraded, our IS/7224 printers connect directly to your IBM systems — just plug them in and print. Easy features and all, our IS/7224 printers cost much less than their IBM counterparts.

For more information, call 1-800-544-4972 (in Michigan, 313/769-5909).

Phone: 313/233-0505, FAX: 313/769-9472

Our IS/7224-200 is compact, economical 200 cps model.

Our high-speed IS/7224-400 prints at 400 cps on up to eight colors.

# Furey to pick up pace at IBM's Santa Teresa lab

BY JEAN S. BOZMAN  
CHICAGO

**SANTA TERESA, Calif.** — The silver-colored towers rising from the floor of this California valley south of San Jose are well-hidden from the public highway. Perhaps that is as it should be at this IBM enclave, however, because the strategic software products being developed here often do not come into public view until

many years have passed.

The view remains peaceful, but the pace is expected to quicken following the recent arrival of Thomas E. Furey Jr., its assistant general manager of IBM Programming Systems and general manager of the Santa Teresa lab. His arrival came on the heels of the departure of lab director Morris Taradash, one of Santa Teresa's top designers for the data repository project, and most recently, Leonard

Liu. However, Furey declined to speak specifically about the status of specific Santa Teresa projects during a recent interview with *Computerworld*.

As director of IBM's Rochester, Mass., lab, Furey pushed the much-anticipated "Silverlake" project out the door as the midrange Application System/400 last year. Now, he expects to make Santa Teresa programmers among the most productive in the software industry. Furey said IBM developers must use computer-aided software engineering tools and artificial-intelligence programs to get more systems products out of the lab and onto the street.

"I fancy myself a leader and a catalyst of change," Furey said. "I want the developers here at Santa Teresa to become the

most productive in the industry." Among their weapons in the battle to develop more software, Furey said, will be state-of-the-art CASE tools and fourth-generation languages. To get the job done, he said, "We're going to use internally what we market externally" — namely, off-the-shelf IBM software tools.

Santa Teresa's mission is a broad one. 1,800 employees are charged with providing products in the following market areas: the IMS and DB2 database management systems, application development environments, languages such as VS Cobol and Fortran, and knowledge-based systems such as expert systems.

The unique demands of IBM's Systems Application Architecture (SAA) will require extraordinary coordination among multiple IBM sites, including Santa Teresa. But Furey also has responsibility for IBM centers in Cary, N.C.; Rochester, Toronto and Bethesda, Md. SAA supports cooperative processing among multiple processors, such as the IBM Personal Computer, the midrange minicomputer and the high-end mainframe.

"My job cuts across a number of [IBM] labs," Furey said. "So the directors who work for me try to orchestrate those elements of the SAA strategy for which they

## S/370 OPTICAL STORAGE

### An Online Alternative for Microfiche, Printed Output, Image Data, and more...

Consider these advantages:

Multiuser Online Query  
Direct Record Access  
Automated Optical Disk Libraries  
High Capacity Storage

Mainframe Compatibility  
Proven Performance  
Cost Savings

Whether it's coded data or image data, the DW 34800 Optical Storage Subsystem stores billions of bytes online—so you can query, process, and distribute information on your mainframe quickly and easily. Call us.

We'll tell you how the DW 34800 Optical Storage Subsystem can put hundreds of gigabytes of image or coded data online, providing direct access to your data and reducing costs at the same time. We'll be glad to answer your questions about S/370 Optical Storage.

DW 34800 performance and features are available now:

**MAINFRAME COMPATIBILITY**  
Data/Ware's DW 34800 Optical Storage Subsystem plugs directly into IBM® S/370 and PCM systems. It attaches as a standard device directly to the channel of your mainframe and provides you with automated optical disk libraries that operate unattended.

**HIGH CAPACITY STORAGE.**  
Data storage capacities from 190 to 750 gigabytes are ordinary tasks for the DW 34800, making it a natural storage device for the large-capacity requirements of image data. Its flexible configurations handle up to four libraries and sixteen optical disk drives from a single subsystem.

**DIRECT RECORD ACCESS**  
The DW 34800 is fast. It provides you direct access to any data on a drive-mounted platter in milliseconds. Automated retrieval of an optical disk in the robotic library is in seconds.

**MULTIUSER SHARED ACCESS**  
Data/Ware's optional Mainframe Document Storage and Retrieval System software (MDRS) is a convenient application interface aiding the integration of the DW 34800 into your document storage and retrieval environment. The MDRS software provides shared direct access to your optically-stored data via high-level

languages, as well as multi-user query capability from TSO, CICS, IMS, and VTAM communications systems.

**SERVICE SUPPORT**  
Data/Ware's maintenance partnership with National Advanced Systems assures a network of DW 34800 parts and service that will meet your needs 365 days a year.

That's just the beginning. There's a lot more to tell. For further facts about the benefits of optical storage using the DW 34800, call Gary Holtwick at...

**data/ware™**  
DEVELOPMENT, INC.

9449 Carroll Park Drive  
San Diego, CA 92121  
Telephone: (619) 453-7660  
FAX: (619) 453-2774

IBM's Furey pushed the AS/400 out the door last year.

are responsible." For example, Furey said, he will be coordinating project management with Edward Altman, assistant general manager for development with IBM Enterprise Systems. DB2 security plans could be checked with Altman, for example, because Altman supervises the development of IBM's security products, including Resource Access Control Facility. Systems Network Architecture changes will be made in the Cary facility.

Furey began his IBM career in 1963 as a systems engineer. Two years later, he moved to IBM's Kingston, N.Y., lab, where he managed the development of mainframe operating systems. Over the years, he managed 21 releases of IBM mainframe operating systems and helped to launch SNA in the mid-1970s. In 1982, he was named technical assistant to current IBM Chief Executive Officer John F. Akers, who was then group executive of IBM's Information Systems and Communications Group.

To make sure things get done in a timely manner, Furey does not plan to travel very far from Santa Teresa, at least in the coming months. He plans to use full-motion videoconference equipment to keep in touch — and on track — with other IBM executives. Frequent plane travel, he said, would detract from his early efforts to shape such key projects as the data repository [CW, March 18] and forthcoming releases of DB2.

# Unisys to blend systems

BY JEAN S. BOZMAN  
OF STAFF

WASHINGTON, D.C. — Unisys Corp.'s Network Computing Group (NCG) is pulling together the multiple versions of systems it sold under the Convergent Technologies, Inc. label prior to its merger with Unisys last year.

In a major strategic shift, NCG is merging its BTOS and CTOS systems into a single system that may soon be renamed CTOS Open. The new operating system will be offered to the software industry as a new multitier platform alongside Unix and OS/2, Unisys told a meeting of the Convergent Technologies Users Forum here last week.

NCG is expected to announce a single new application programming interface (API) that will converge most BTOS and CTOS applications and communications software by the second quarter of 1990.

The new API is scheduled to be announced at a users' meeting in Paris this week. That API will be the standard for new applications running BTOS and CTOS software, including modified versions sold by France's Groupe Bull in Europe.

Landmark Communications, Inc., a \$400 million publishing and broadcasting company in Norfolk, Va., that has 700 BTOS and CTOS machines, is looking for-

ward to the BTOS/CTOS merger. "It was difficult for software developers to commit to CTOS because there were so many flavors of it," said Roland Davis, a Landmark vice-president. "If you have one version worldwide, it should become very attractive." The flavors evolved as Convergent sold its machines to multiple vendors, most of which added extensions to the basic system.

Unisys' moves should help to smooth over differences in applications running on NCG's installed base of 603,300 systems worldwide. "There is a standardization effort, driven by the user commu-

ty," said Arun Taneja, director of marketing at NCG's Charter Systems Division. "We're merging all of our systems together, although it will take a few years."

Once those are merged, Unisys intends to tailor its CTOS offerings for different market niches with add-ons. For example, BTOS/CTOS will be packaged with a Foxit server for government accounts, Unisys said. Commercial users might find the merged system coupled with IBM and Microsoft Corp.'s OS/2 Presentation Manager or Oracle Corp.'s Oracle/SQL, Unisys said.

Another NCG imperative is to "emul-

fold" DOS to make sales into IBM-compatible shops.

The first wave of the merger, scheduled for the third quarter of this year, will provide common support for X.400 electronic mail, X.25 packet-switched protocols, Transmission Control Protocol/Internet Protocol, IBM's Systems Network Architecture, Ethernet and Token-Ring. By the second quarter of 1990, most BTOS communications products will be available to CTOS users and vice versa, Taneja said.

Taneja said most users want to network their isolated CTOS work groups together for enterprise-wide applications, including transaction processing. The advantage of using BTOS/CTOS, he said, is that the Convergent systems' message-oriented design can outperform Unix and OS/2 for some distributed-processing applications.

## Unix users get four-tier service

BY ROSEMARY HAMILTON  
OF STAFF

BLUE BELL, Pa. — Unisys Corp. recently released a new maintenance plan that for the first time allows users to select the level of service they want and also combines hardware and software maintenance into one contract.

Unisys will initially offer this Surety plan to its Unix customers. By the end of this year, Unisys will provide Surety to its personal computer customers and A series mainframe users, according to George Gusewita, president of Unisys' customer service and support division. In early 1990, Surety will be introduced for the Unisys 2200 mainframes.

The Surety plan has four levels of service, starting with basic maintenance coverage that offers phone support for hardware and software problems. Each additional level offers more features, with the highest level of service, called the comprehensive package, offering guarantees for response times, on-site service, replacement parts and software maintenance updates.

Previously, a Unisys customer was required to sign a contract for hardware coverage and a separate deal for software maintenance. Surety combines the coverage so a user's complete system is covered by one contract.

Pricing will be based on the number of systems and the level of service requested. For example, a 5000 series user could pay as little as \$65 per month for the first level, called Intro, or up to \$475 per month for the comprehensive package,

# Stop your soul searching.

Get Microsoft Excel now for only \$233.

Microsoft® Excel has been called, "The soul of the new machines." And it's easy to see why. Because unlike any spreadsheet program that came before, Microsoft Excel unleashes the power inside the new generation of PCs.

Speed is the one thing that today's spreadsheet users hunger for most. And Microsoft Excel more than satisfies. It squeezes every megahertz out of the new machines' microprocessors. And by keeping recalculation to a minimum, Microsoft Excel makes your "what-if" analyses really fly.

Microsoft Excel also makes your spreadsheets more appealing to the eye. It lets you add typefaces, borders and shading. So you can turn rows and

columns of numbers into reports that say a whole lot more.

Finally, Microsoft Excel lets you step into the future without turning your back on the past. With it, you can easily read and write files from other popular programs including Symphony™ and Lotus® 1-2-3®.

So end your quest for power, here and now, just call Software Spectrum and order Microsoft Excel for the previously unheard-of price of only \$233. And in addition to a bargain, Software Spectrum will give you one other thing that corporate buyers are eager to find. Exceptional service, time after time.

For more information, or to open a corporate account, call 1-800-624-0503.

**SOFTWARE  
SPECTRUM**

## Indecision

CONTINUED FROM PAGE 21

happens entirely to get software developers to write for their machines. Because there is a variety of parallel processing architectures — vector machines employing pipelining and the chaining of functional units, long instruction word machines using multiple functional units and numerous multiprocessor configurations — it is difficult for software developers to focus their attentions.

"Real progress in fulfilling the promise of parallel processing isn't likely to occur until one of these solutions becomes the clear winner," said Omeri Serin, a Los Altos, Calif.-based consultant who produces the "Serin Report on Parallel Processing" monthly newsletter.

Until then, much of the attention has been focused on recompiling software written for conventional, scalar architectures. This, too, has problems. Compiling can be difficult and tedious, while conventional scalar development and debugging techniques are often ineffective in architectures using a large number of interconnected architectures.

Compiling is often difficult. "What we may eventually need is a whole new generation of programmers writing programs from scratch with the idea that they are going to be run on many processors," said Patricia Laupheimer, vice-president of technology at Shearson Lehman Hutton, Inc.

That, too, may be difficult to achieve in a world in which giant software organizations as Microsoft Corp. and Ashton-Tate Corp. have difficulty maintaining an update schedule for their current product line.

Additionally, conventional operating systems are not suited to supporting configurations with a large number of processors. If these operating systems treat each task allocated to a processor as a separate user, there is no time left for processing — only scheduling.

An emerging solution to this problem is the concept of lightweight objects, or subtasks that share resources allocated to the main process, thus allowing more rapid scheduling. Convex has begun to offer such capabilities in its C2 line of tightly coupled vector processors.

Another concern that must be addressed if massively parallel systems are ever to reach substantial commercial inroads is ironing out the problem of data coherency, or making sure the processors inform one another when they have changed or located data.

Unfortunately, there is no guarantee any of these solutions will clear all of the stumbling blocks. "The word 'must' doesn't necessarily make things happen," said Charles Cassle, president of the Aberdeen Group, a market research firm in Boston. "But they'll always be a market for specialty machines, which is where I believe these machines are destined to remain. Their challenges are just too formidable."

What is clearly needed is less hardware exploration and more solving of the software development problems. IBM and Digital Equipment Corp. already have parallel Fortran versions. Indiana University is developing the Sigma system of parallel development tools and NCube has announced that it will be porting Oracle Corp.'s popular DBMS over to its new machines this week.

## Gibson

CONTINUED FROM PAGE 21

cently acknowledged that his firm may be being "fettened up" for a feast by IBM. But, he asked, what choice was there?

Plants that grow too well could become a target for the pruning shears. Cullinet, for example, by selling IDMS/R over the years, may have brought many hardware sales to IBM. Now, even after a successful DB2 campaign, IBM is still trying to drain off Cullinet's user base by staging promotions to get people to convert from IDMS to DB2.

In addition, Cullinet makes computer-aided software engineering (CASE) tools. Do you think they are in the inner circle

of those CASE vendors that are working with IBM on the repository project? No. How about Oracle, also a vendor of CASE tools? No. That is because Oracle is mainly a relational database management system prodigy. Oracle and Cullinet are both five to 10 times larger than the companies — such as Index Technology — with which IBM is working closely.

The difference in treatment is not lost on the companies involved. At a recent meeting between software vendors and IBM, Cullinet's John Landry reportedly voiced his discontent with IBM's selective breeding process. A number of smaller CASE vendors are also resentful of IBM's tendency to choose favorites.

The issue resurfaced recently when IBM invested in Management Science

America, Inc. I suspect there was plenty of outrage at MSA archival McCormack & Dodge. Should M&D have been surprised by IBM's move? MSA is working on its development for IBM systems only, while M&D is doing a fair bit of work for Digital Equipment Corp. systems.

Could IBM's move be as much a reaction against M&D's advocacy of DEC as it was to assist MSA?

Although IBM seeks to portray itself as fostering growth for growth's sake in the software world, IBM will never be able to put aside its self-interest. Once a software vendor has had its best years, it could become the victim of crop rotation.

Gibson is *Computerworld's* senior editor, software.

## NEW PRODUCTS — SOFTWARE

## Database management systems

On-Line Software International, Inc. has announced software designed to analyze, maintain and tune IBM DB2 software systems.

Called *Prostar/Plus*, the package reportedly allows DB2 database administrators to use ISPF-like panels to view and modify DB2 objects and optimize DB2 application performance. The database utilities can be submitted on a DB2 object or another object and all of its dependents, the vendor said.

*Prostar/Plus* costs \$25,000. Twelve- and 36-month lease plans, advisory discounts and corporate licenses are also available.

**415-598-8000**

Schumann Consulting Group, Inc. has announced Data Base Control (DBC) Release 4.0.

The software reportedly monitors the space, pointers and performance of IMS or DL/I database operation in IBM MVS or MVS/CA shops running IMS DB/DC or CICS. DBC inspects the databases and reports to the database administrator on

those that require corrective action, the company said. Enhancements reportedly include performance and space-usage analysis capabilities. A perpetual CPU license is available for \$50,000. Schumann Consulting Group 333 Sylvia Ave. Englewood Cliffs, N.J. 07632 800-533-9103

## Development tools

Netrat, Inc. has simultaneously released Version 2.04 of its Netron/CAP software engineering systems for six micro, mini and mainframe development platforms, including systems offered by IBM, Digital Equipment Corp. and Wang Laboratories, Inc., the company said.

The product is targeted at personal computer-based mainframe application developers and reportedly offers enhancements to all seven of the software's target platforms for portable Cobol applications, including IBM CICS and IMS mainframe environments. The latest release includes enhanced debugging functions and a cross-reference system for impact analysis.

Netron/CAP Version 2.04 is priced according to the chosen combination of development and target environments and the number of licensed terminals. Licenses start at approximately \$50,000. Netron

**416-636-8333**

California Software Systems, Inc. has announced that it has developed a personal computer-based software system that reportedly emulates the IBM System/36 environment of the IBM Application System/400.

According to the vendor, AS/400 minicomputer users running RPG-II applications in the System/36 environment will be able to run the same application on Intel Corp. 80286 and 80386-based personal computers and local-area networks. The product is called the Baby Application System for the AS/400 and is reported to be the first in a series of three software releases designed to replicate the enhanced RPG environment of the AS/400.

Pricing begins at \$4,000 for stand-alone PCs.

## Applications packages

Trax Software, Inc. has announced Edward 2.0, a word-processing package that supports IBM's MVS/3A and MVS/ESA mainframe operating systems.

The latest version provides the ability to operate at higher than 16M bytes for large documentation requirements, the vendor said.

The software reportedly permits users to create documents and reports such as annual reports, registered stockholders' lists and software user documentation in a multitasking environment. A perpetual license for Edward ranges from \$6,500 to \$11,500, depending on which CPU is used.

It seems like every computer company wants you to count on their commitment to open systems, total solutions and a customer-oriented outlook.

And then there's Unisys. We're not just asking you to count on some vision of the future. We're here to show you a complete UNIX offering built on a solid framework of deliverable products, designed to reflect what we've learned from our customers.

## AN UNMATCHED LINE

Consider our UNIX hardware. It's the most comprehensive commercial UNIX line in the business. From PC to multiple-processor mainframe power, from one to hundreds of users.

Our U Series, for example, combines superior price-performance throughout the line, with PC integration capabilities built right in.

Then there's UNIX System V. itself. We adopted it years ago because our customers' needs pointed to it. Today, it's the open system with thousands of applications already available. And a worldwide base of customers already investing in it. We've added simplified

networking capabilities to make our UNIX systems readily compatible with networks like Ethernet.

And we've put the most popular database software on our systems. Plus productivity tools like Unisys MAPPER LINC and ALLY systems that go beyond 4GLs and CASE to ease implementation and help reduce training costs.

## BUSINESS AS USUAL

The point of it all is to put the real power of the UNIX operating system in your hands. Freedom to design optimal (cost, performance, quality) solutions without technical constraints or changing the way you do business.

When you think about open systems, think about UNIX System V—the open system that's working today. And when you think about the UNIX operating system, think of your freedom to choose any vendor you want.

Then choose Unisys—the computer company that's put it all together. Right now, we're offering a free booklet, *How to Speak Open Systems*. A fun and helpful glossary of generic Open Systems terms, it's yours for the asking. 1-800-547-8362.

UNISYS AND YOU.

The power of 2

# UNISYS

If You Keep  
An Open Mind,  
You Don't Stop  
With The Standards.

# You Begin.

There's a big difference between settling for standards and setting them. At NCR, we're open-minded about open systems architecture. That means the standard is the starting point; and the sky's the limit on how flexibly the technology can be applied and advanced.

With technology, we're so open-minded that our 25MHz 386 is faster than a 25MHz 386. How? We didn't settle for the standard 32KB of cache memory offered in many other PCs. Instead, we raised it to 64KB. This gives our new PC925™ faster response time and throughput. The result—increased productivity. And one more example of NCR

adding value to advance an industry standard to a new standard of excellence in performance.

Our open-mindedness opens unlimited opportunities for applying PC technology to a variety of business problems. Because no business considers its computer needs standard.

At NCR, we're open to finding the PC solution you have in mind for your business.

If you're open to this kind of thinking, call 1 800 544-3333 for a free literature packet and the location of the Authorized NCR Reseller or sales representative nearest you. Or write to us at P.O. Box 785, Dayton, Ohio 45482-9905.

NCR PERSONAL COMPUTERS

Creating value

**Introducing The Wyse Networker.** It delivers all the power and performance of a 12.5MHz 286 PC. With all the styling and ergonomics of a Wyse terminal.

And while The Networker puts PC capabilities on user's desks, it provides MIS management with data and software security. Users access disk storage over the network. There's no local storage — no removable disks.

The Wyse Networker fits comfortably on less than a square foot of desk space. Yet it

comes loaded with a full megabyte of RAM and built-in VGA. Plus the flexibility to work with virtually any network, from 3Com and Novell to IBM Token Ring and Ethernet. Because it's modular, The Networker will adapt readily to other network environments, as well.

The Networker is also part of System-Wyse.® So it links easily with powerful Wyse 286 or 386 file servers to create network solutions with compatibility and connectivity built in.

The all new Wyse Networker. Only a com-

pany that's a leader in both personal computers and computer terminals could come up with a product like it. Which is why Wyse Technology is the company that did. 1800-GET-WYSE.

## MICRO BITS

Douglas Barney

### A few nice words...

More than a few of my favorite things. Regular readers of this column could conceivably view vendors as the whitest group of losers ever hatched. But they really aren't so bad. Sure, they can be price gougers and deceitful, but they often create excellent products and occasionally even listen to customers.

If it weren't for vendors, we would have very few technical advances, fewer competitive battles that create better products and nobody to make fun of.

Most vendors do not understand why we bash them so. Here's the answer: There is an inherent conflict between those that sell products and those that buy them. Buyers want products cheap. Sellers want them expensive. Buyers want products to work. Sellers just want them sold.

This newspaper happens to represent buyers. If we were *Vendeworld*, I'm sure we'd have plenty of articles about the perils of the long sales cycle and nit-picky buyers that squeeze margins and demand the world.

Despite this conflict, there is frequently a common ground.

## Upgraded Windows opens onto new vistas

### ANALYSIS

BY DOUGLAS BARNEY  
OF STAFF

REDMOND, Wash. — On the eve of Presentation Manager applications delivery, Microsoft Corp. anxiously presses on with its mission to establish and enhance Windows.

Later this year the firm will launch Windows 3.0, its biggest upgrade ever, which is expected to overcome its greatest barrier: the dreaded 640K-byte limit. This is also one of the key selling points of OS/2 Presentation Manager, which will itself gain applications beginning this summer and stretching into the rest of this year.

Meanwhile, vendors — particularly mainframe software houses and IBM — are preparing cooperative processing-style Presentation Manager applications. This, along with the dramatic new capabilities of Windows, has turned a formerly segmented market into one of overlap and confusion.

Windows 3.0, often demonstrated but not yet announced, is expected to visit Windows directly into OS/2 and Unix large-memory territory. Furthermore, the ability to run in a so-called protected mode (i.e., with direct access to 18M bytes of random-access memory) has caused some key personal computer vendors to reconsider their previously harsh feelings

### Windows opens lead

Microsoft's Windows maintains its dominant position among PC windowing software as such products in OS/2 Presentation Manager gear up for market push

toward Windows.

Microsoft always maintained that Windows would remain a "real mode" or 640K-byte product; therefore, Windows 3.0 caught many by surprise. For most, however, the experience has been pleasant.

Nevertheless, the similarities between Windows 3.0 and Presentation Manager are apt to confuse users. "The only thing OS/2 has that 3.0 doesn't is multitasking," said Carole Patton, editor and publisher of "Ac-

## Sun, Toshiba 'sparc' low-end battle

BY MICHAEL ALEXANDER  
OF STAFF

The recent pact between Sun Microsystems, Inc. and Toshiba Corp. to build Sparc workstations signals that the Sparc-compatible market is gaining momentum; it also foreshadows an intense battle for the low end of the workstation marketplace, according to industry observers.

Last month, Sun and Toshiba signed an agreement that will permit Toshiba to develop low-cost workstations using Sun's Scalable Processor Architecture (Sparc) microprocessor architecture.

texture and SunOS Unix operating system. Toshiba will include Open Look, the graphical user interface developed by Sun and AT&T, with its computers. The company said it planned to have the first of its Sun Sparc clones on the market early next year.

In April, Sun introduced three workstations — the Sparcstation 1, Sparcstation 330 and Sparcstation 370 — based on its own reduced instruction set computing microprocessor. Sparcstation 1, priced at \$9,000, fueled the company's push into the low-end workstation business.

Solbourne Computer, Inc. announced recently that it had pared the prices of its Series 4/650 and 4/800 desktop models; the company calls "Sun-4 compatibles" to make them more competitive with Sun's machines.

### Others join in

Solbourne also recently introduced two Sparc-compatible file servers, the Series 4/530 Workgroup Server and Series 4/670 Departmental Server.

Several other companies are expected to introduce low-cost Sparc clones in a price range of

\$5,000 to \$10,000 within the next few months. Sun has been encouraging other vendors to build compatible versions of its workstations, a tactic that could backfire as competitors intensify, according to David Card, an analyst for International Data Corp., a Framingham, Mass.-based market research firm.

## First COBOL Presentation Manager Application! See It At PCExpo/CASECON

Micro Focus, the company that introduced COBOL to the PC, will be giving an advance peek at an exciting breakthrough for COBOL and COBOL application developers. Micro Focus will be showing a sample Presentation Manager application developed entirely in Micro Focus COBOL/2 using its powerful new extensions to the COBOL syntax.

At the same time, Micro Focus will be showing the SQL support to be embedded in the COBOL/2 compiler and several other features that will change the way programmers think about COBOL.

Stop by and see Micro Focus COBOL/2 at IBM's Booth #460 at PCExpo and Micro Focus' Booth #4018 at National CASECON, June 20-22nd, New York, Jacob K. Javits Convention Center.

*"IBM's newest Proprinter models  
have arrived with another load  
of features and functions to please users..."*

*—PC Magazine*

*"Proprinter  
gets an A."*

*—PC Week*

*"IBM has souped up  
both Proprinters,  
and the wide-carriage XL  
model really hauls."*

*—PC Magazine*

# III

At last count there were nearly one hundred 9-pin printers to choose from.

So when you're about to put your money down, you need all the help you can get. And when that help is from some tough critics it means something.

IBM Proprinters have always been popular. In fact, our Proprinter™ II model has been one of the best selling printers in its price range for the last three years.

And our latest models are better than ever.

The new Proprinter III and wide-carriage III XL are so efficiently designed they will make everyone in the office more productive. They're easier to learn, easier to use, they operate much faster, make your documents look better and have fewer parts that can go wrong.

And they're so simple to operate. When switching from continuous forms to single sheets to envelopes, you can do it just by using the one-touch Propark button.

Combine that with much faster throughput and it's easy to see why our new Proprinter models will be more popular than ever.

## If You're Looking To Make Your Business Run Faster, Look No Further.

To find out more about the Proprinter III or our complete family of printers, see your IBM Authorized Dealer or your IBM marketing representative today. To find the dealer nearest you, call 1 800 IBM-2468, ext. 130.

You'll discover why our printers continue to get such rave reviews.

**Letter Quality Faxes  
In Under 6 Seconds.**

**Video Conferencing  
For \$12 An Hour.**

**High Speed Data  
For The Price Of A Voice Call.**

**And** these are just a few of the breakthroughs made possible by US Sprint's remarkable new data service, FON 56™.

For the first time ever, it lets you send data anywhere in America at 56kbps over a fiber optic voice line, without expensive private lines or access charges.

Making possible a new generation of fax machines that can send a letter quality page in less than six seconds.

Dropping the cost of video conferencing from \$300 an hour to \$12.

And cutting the cost of sending bulk data at 56kbps from over a dollar a minute to about 10 to 12 cents.

These and many more applications are made possible by US Sprint's exclusive nationwide 100% digital fiber optic network, which gives FON 56 a level of reliability never before possible over voice lines.

They're all available right now to US Sprint VPN™ customers, and to other business customers later this year.

To see what FON 56 can do for your company, call your Account Manager today. And talk with the best.

Pomp,  
circumstance  
and a virus

One of our regular readers called last week to alert us to be on the lookout for college students' careers carrying viruses.

The caller predicted that businesses that choose their new employees from this year's crop of college graduates will get hit with computer viruses to boot. The big idea is that viruses are running rampant on college campuses, and college students — being, well, students — are apt to take with them illegal copies of favorite programs when they leave campus. The caller said the real problem — beyond the software copying issue — is that these pilleried programs will as likely as not be infected with viruses.

Computer viruses are a fact of life on college campuses, the caller pointed out. They even named one of the more insidious viruses after Lehigh University. From campus to corporate computer system is only a short leap of the imagination, our reader warned us.

At the same time, it's also quite a stretch of the imagination. College students are guilty of a lot of sins but certainly no more than anyone else. In any event, compared with some of the rowdies that I used to run with in the late '60s and early '70s, today's average college student seems rather tame. But if there's a moral here, it is that computer viruses can hit you from any direction, even from a freshly scrubbed recruit who is eager to put into practice what he or she has learned in academia.

It's a real trick to keep employees from inadvertently infecting viruses into the company's computers — more now than ever with the extraordinary popularity of personal computers and local-area networks. One place to start, though, would be to prohibit employees without exception from using their own software on the company's machines.

It really doesn't matter where the software comes from: Whether it is freeware, shareware or a commercial product, all could carry viruses. Of course, by doing this, you're not

## Magellan users no longer searching

With indexing and multiple search methods, users say stray pieces of data aren't so hard to find

BY DOUGLAS BARNEY  
OF STAFF

Among other promised features, Lotus Development Corp.'s Magellan claims to find a stray piece of information and launch a user into the application that created it. All this is supposed to happen without the hassle of searching through file after file and directory after directory.

False advertising? Not according to early users of the product.

Magellan works by indexing all the files on a user's hard disk. It then allows users to scan files — including batch files — or it can search based on a word, phrase or concept.

Once the relevant file is located, the system can launch directly into the application with the file already loaded. It can also gather pieces from various files and collect them in one master file to create a report or summary.

To top it off, Lotus threw in the ability to copy, move, delete and print files. Users can also re-sort their files based on size and

creation date or in alphabetical order using Magellan menus.

Tom Ferguson, a research and development analyst for the city of Phoenix, said he finds Magellan, which has been available since April, a bit addicting. He said he enjoys the file scanning capability, which allows him to view the contents of files as they scan through a directory.

**Eurokel**

Ferguson also said he found that Magellan files much of the bill as a personal information manager, allowing him to find random bits of information that otherwise would be lost.

According to Ferguson, the product will probably see broad use within the city of Phoenix' municipal government.

One application under consideration is to set up a system to retrieve and pursue city rules and regulations. With Magellan, a user could simply ask for all the references to fireworks, for example, get a list of relevant files and gather them together into one.

• Mary Campbell, who has

written 16 books about computers and sees a variety of word processing packages depending on which publisher she is writing for, is another Magellan user.

Before that product, finding information was like "a wild goose chase," said Campbell, who founded Campbell & Associates, a consulting firm that focuses on PC training. She had to know what word processor created it, load it and start reading files.

"Now with Magellan, I can do text searches, and it doesn't matter where it is," she said.

**Pushing it**

In Ottawa, Nigel Chubb is pushing Magellan further than it was designed to be pushed — with good results. Chubb, manager of technology at Canada Post Co., is using the MS-DOS-based Magellan in conjunction with IBM's OS/2 Extended Edition. He uses Magellan in the OS/2 compatibility box to search OS/2 Extended Edition files and reported no problems.

Chubb has become increasingly reliant on Magellan's ability

to read multiple file formats and gather pieces of files into one. This is extremely handy, as Chubb is called on to generate reports based on information sent in a variety of ways.

"The product is more profound than a lot of people realize," Chubb said. In fact, Chubb has been tested the product and, as part of the agreement, removed it from his hard disk once the test ended. "I missed it," Chubb said.

Magellan runs on IBM Personal Computers and compatibles with at least 512K bytes of memory and a hard disk. The system is also aimed at systems that are equipped with compact disk/read-only memory and can contain up to a half gigabyte of data.

The product supports many popular file formats but does not yet work effectively with Microsoft Corp. Windows applications. It also works with ASCII text.

Lotus is currently developing additional viewers for popular applications. Those viewers can be added to the system without the software.

Magellan retails for \$195.

## Certus stands guard at system doors

Large-scope vaccine bars foreign software, detects minute file changes

BY RICHARD PASTERE  
OF STAFF

Security-conscious microcomputer users more than a virus bloodhound; they need a vigilant watchdog and an overall security manager. Early users say they have found such a beast in Foundationware's Certus.

"It has a larger scope than the products focused specifically on a type or strain of virus," said John O'Leary, managing director of Northboro, Mass.-based Computer Security Institute's Educational Resource Center.

Certus, known as Corporate Vaccine when it was announced in April 1988, can restore systems from hard-disk crashes, prevent unauthorized software from being run and detect minute changes to system software. It also monitors and records attempts to run unauthorized software and limits writing to and downloading from the hard drive once the system is restored.

O'Leary, who demonstrates Certus along with other security products in educational seminars nationwide, said he is impressed with its monitoring function. The program detects and reports changes made on programs, the operating system, user-selected files and the Certus program itself.

"Anyone looking for [security]

products needs to have some feature like that because it's important to see if your environment has changed since the last

Computer Security Institute's O'Leary is impressed with Certus' monitoring ability.

time you used it," O'Leary said.

Tom Hartnack, technical support manager at beta site Marine Midland Bank in Buffalo, N.Y., described how he challenged Certus' monitoring ability. He changed a single bit of a file, taking care that the file size, date and time were not altered. "It picked up on that one little change," Hartnack said. "We thought that was pretty important."

The product guards against viruses by allowing only software authorized by the systems

manager to run, and it tracks and logs attempts to run unauthorized programs. According to beta users, these defenses were very difficult to dodge.

"It is not something that the average user can defeat," said George Collins, security consultant at beta site Booz, Allen & Hamilton, Inc. in Bethesda, Md.

"There is no intuitively obvious way to defeat it," O'Leary added.

**Crash recovery**

Another prominent feature of the program is its creation of a system backup disk during installation that reportedly can be booted up to recover a system from most hard-disk crashes. Certus can also be used to guard against data theft by preventing the copying of hard-disk data to floppy drives.

Certus operates in background, allowing end users to interact with the system and applications as they have done in the past. Hartnack said he appreciates Certus' transparency because when evaluating other security programs, he "had to go through their interfaces, which were very clumsy."

Despite Certus' depth of function, it uses only 5K bytes of random-access memory. However, it consumes 800K bytes of hard-disk space, according to Collins.

Installation is simple, Hartnack said. Depending on the hard drive, it can take about 15 minutes and is "very automatic," he noted.

There were some problems with the product, however. Hartnack made suggestions to improve the clarity of the installation procedure and increase the flexibility of some features.

Foundationware implemented these suggestions and also made adjustments so that the program could run in parallel with two of Marine Midland Bank's word processing packages.

The bank has decided to standardize on Certus and received shipment last week of some of the approximately 50 copies that will be installed in offices in New York, Chicago and San Leandro, Calif.

The product runs on IBM Personal Computers, XTAs, ATAs, Personal System/2s and compatibles running DOS 3.0 through 4.0. Certus retails for a price of \$189.

O'Leary and Hartnack are awaiting the arrival of Certus' local-area network version, which is slated for the fall.

The program will reportedly reside on file servers of DOS-compatible, IBM NetWare local-area networks.

## Windows

FROM PAGE 33

knowledge," a newsletter for users and developers. Multithreading allows applications to multitask within themselves so that, for example, a spreadsheet can print while another is being created. "Customers are going to question why they should buy OS/2," added Said Mohammed, chairman of Windows developer Shanna Corp.

For now, Windows 3.0 is 386-specific, but Microsoft has committed to a 286 version, Patton said. According to Patton, Windows 3.0 also features improved network support and new menu types such as floating and hanging menus.

Microsoft advises customers who are focused on packaged applications to move to Windows. Those who are developing internal applications, however, should consider the Presentation Manager, according to Rich Abel, group product manager at Microsoft.

### Long and winding road

It has been a long and seemingly endless road for those who hopped into this new world of graphical user interfaces. Certain milestones, however, have been reached. There are now some 500 Windows applications shipping, and Microsoft has shipped 2.2 million copies worldwide, according to Framingham, Mass., market research firm International Data Corp. Key U.S. organizations have made serious commitments to Windows.

Despite these gains, however, several users have maintained that Windows is less attractive than OS/2. "If I want Windows, I'll buy a Mac," said Steve Mullins, a PC specialist at the Krannert School of Management at Purdue University.

"We've brought Windows in to look at, but apart from Aldus' Pagemaker and Micrografix products, there is nothing exciting under Windows," said Gary Wagner, a systems programmer at People's Gas Light and Coke Co. in Chicago.

The mainstream applications drought may change. Holdout Wordperfect Corp. is now "considering" a Windows version, and a high-level Ashton-Tate Corp. source said his firm was about to decide to develop a Windows version of Dbase.

After Apple Computer, Inc. filed suit claiming that Microsoft violated its copyrights, Borland International publicly bailed out of Windows. However, said Paul Steinberg, North Central district manager at Borland, his firm is now reevaluating because a protected-mode Windows would provide room for Paradox, Windows and plenty of data.

*Midwest Correspondent Eliza Becker contributed to this report.*

FROM PAGE 33

particularly when vendors combine innovation with responsiveness to customer needs. Funny — those are the companies that tend to survive and prosper.

So, in fairness, I decided to rack the old brain and say some nice things about vendors for a

change. There will be a minimum of snideness.

IBM: They're big. They're expensive. But when pressed, IBM can produce things that are truly reliable and stand up to years of technical change and abuse. The 370 mainframe family goes back decades, but some of America's most important organizations, including the space shuttle, could not work without

them. This beast of a company is not afraid to stick its neck out and take a few lumps. That's class.

Compaq: They're big. They're expensive. But Compaq has proven that high performance personal computers can be compatible and reliable. They're also shown that a firm less than a decade old can garner the same exact reputation as

IBM, and that keeps everyone on their toes.

Apple: They're big. They're expensive. But Apple has convinced computer phobics that these devices are okay. They have also pressured IBM into following (albeit years later) Apple's lead in graphical user interfaces. Best of all, Apple has proven that there is nothing healthier in American business

"I caught it. I cleaned it.  
I put it in the oven,  
and it's working fine."

IBM Corp. Photo: IBM Corp.

Circle 10 on Reader Service Card

than an interesting alternative to a boring industry standard. And they're fun!

Microsoft: It doesn't seem fair that Microsoft prospered by popularizing one of the most arcane and annoying operating systems ever cobbled. Yet Microsoft has done great things for this industry. It is the only firm that has hurled insults at Lotus that actually stuck, and it is the

firm that has put it all on the line to legitimize PC graphical interfaces. Best of all, by relentlessly chasing new technology after new technology (after someone else pioneers it), Microsoft has provided what users desire most: good products.

Lotus: This company is an easy target for barbs. That's why so many miss the inherent strength that comes from acute-

ly focusing on such IS issues as communications, programability and multiple platforms. Besides, Lotus' unshipped products are better than most other people's unshipped products.

Oracle: These guys get away with murder by saying one thing and delivering another. Slapping around Oracle has become a popular pastime among competitors and a select group

of analysts. But this overactive firm from Belmont, Calif., has done more to further the causes of SQL, applications portability and distributed databases than anyone else. Plus it has kicked IBM in the pants a few times to boot. For this, it should be recognized.

Barney is a *Computerworld* senior editor, PCs and workstations.

Not that Alan Tompkins expected it to work. After all, his HP graphics plotter had spent three months at the bottom of the Alsea River in Oregon. Ever since it was stolen from his office.

"I washed it out with a garden hose, dried it in the oven and plugged it in," Tompkins said. "Much to my surprise, it sprang to life and started spitting out graphs and charts."

Even at HP, our products don't go through humidity tests quite this severe. But almost. Because we know that a dud printer or plotter can sink your operation in a hurry. So, in 1980, we set up a Total Quality Control program to reduce failure rates tenfold by 1990. And we're right on schedule.

The result: a 20,000-hour MTBF rating on our DeskJet, PaintJet and RuggedWriter printers; the Number One ranking for the HP LaserJet Series II in PC Week's Poll of Corporate Satisfaction;\* and a warranty on our small and large pen plotters four times longer than the competition.

So call 1-800-752-0900, Ext. 275X for your nearest authorized HP dealer. You'll get a better product. And that's no fish story.

There is a better way.

HEWLETT  
PACKARD

FROM PAGE 37

going to win any popularity contests.

If you don't think it is practical or even possible to regulate the software used on the company's computers, then it is incumbent on the personal computer manager or information center to train end users to properly handle software (as well as other security-related issues, of course).

I spoke to a PC manager at a large Midwest university to find out whether he believed that college students are more likely to spread viruses than anyone else. He made a few jokes about students carrying all sorts of unusual ailments but naturally did not think this year's graduating class went out into the business world to spread computer viruses like plagues.

The manager has had his share of problems caused by computer viruses, he says, and he has had to be more stringent about what software students can run on PCs set up for their use. If students want to run programs at the library computing center, their software gets a close look-see on a stand-alone machine before they even enter the computer facility. It's not a foolproof practice, but it seems to have helped, he says.

This same PC manager also says he makes sure to have backup copies of all system software stored in a safe place and that he regularly checks the software in use for signs of infection.

Those are worthwhile procedures, but he could do more. The National LAN Lab, which has a list of user guidelines for combating viruses, adds that system software should be backed up once a month, with the backup stored for at least one year before it is used again.

Once purchased, the software should be reviewed carefully by the system manager before it is installed on a distributed system.

## NEW PRODUCTS

## Software applications packages

Specifications of material properties commonly used for structural design are now available on a database from Engineering Software Co.

The Properties Module is a personal computer-based package that provides technical information on most commonly used steel or wood structural properties, the company said. The software was designed to eliminate manual researching and is priced at \$595.

Engineering Software

10670 N. Central Expwy.  
Dallas, Texas 75231

IBM Software Products Corp. has updated its data analysis and graphics software package for IBM Personal Computers and compatibles.

Release 4.0 of RS/1 was designed specifically for research and development, engineering and manufacturing quality-control applications, the company said. Enhancements reportedly include additional statistical methods and graphics capabilities as well as revised documenta-

tion containing statistical algorithm references. The software costs \$2,000 per single copy, and quantity discounts are available. Current customers can upgrade for \$95.

IBM Software Products  
10 Fawcett St.  
Cambridge, Mass. 02238  
617-873-5000

Digital Vision, Inc. has upgraded its video digitizer system software, the company said.

Computereyes Version 3.1 operates with an IBM Personal Computer, and captured images are displayed with Hercules Computer Technology Co.'s Hercules, IBM's Video Graphics Array or other standard graphics capabilities. No addi-

tional hardware is required, according to the vendor. Features reportedly include a device driver package for developers and support for high-resolution 640- by 480-pixel image capture. The product is priced at \$249.95; current customers may upgrade to the new release for \$15.

Dedham, Mass. 02026  
617-329-5400

## Software utilities

A diagnostic software tool for IBM Personal Computers, Personal System/2s and compatibles has been introduced by Jensen Tools, Inc.

Called Helpline, the program reportedly reports on processor type, clock speed and drive size and was designed to assist technicians in repairing or maintaining unfamiliar PC systems. The product locates hidden files, system files, drivers, applications and libraries and requires 256K bytes of random-access memory. Helpline costs \$99.

Jensen Tools  
7815 S. 46th St.  
Phoenix, Ariz. 85044  
602-968-6241

A hard-disk locking utility designed to offer protection against unauthorized access to stored data has been introduced by Rupp Corp.

Fastlock allows computer users to lock up their hard disks in less than 15 seconds, the vendor said. The product encrypts the access table to the system files, and authorized users must submit the proper predetermined password to access the system. It is priced at \$69.95.

New York, N.Y. 10021  
212-517-7775

## OS/2 software

Underware, Inc. has announced that its program editor package, Brief, is now available to run in the IBM OS/2 operating environment.

The software reportedly includes a special-purpose compiled language to customize the editor to suit the user's needs. Tutorial aids, language-sensitive indenting, a LISP-like syntax and a C-like alternative macro language syntax are also provided. The package costs \$195, and toll-free technical support is available, the vendor said.

Underware  
321 Columbus Ave.  
Boston, Mass. 02116  
617-267-9743

## Macintosh products

Jasmine Technologies, Inc. has introduced a digital audio tape drive for Apple Computer, Inc. Macintosh computers.

According to the vendor, the Jasmine Directigital Tape has a 1.2G-byte capacity and is capable of locating data anywhere on the tape within 40 seconds. The mass storage system reportedly transfers 1M byte of data in an average of 25 seconds and utilizes a 4mm tape-cassette format.

It is priced at \$6,995.

A price/performance breakthrough for 386-based systems, the new Tandy 4000 SX combines more integrated features than ever before in a machine at this price.

The Intel 80386SX microprocessor combines the ability to operate high-performance 80386 based software, as well as current 80286 and 8088 based software. You get the combination of 32-bit performance with 16-bit hardware compatibility.

This means the Tandy 4000 SX means your center investment for the future. As a

low-cost alternative to an expensive 386 system, you won't be left behind when you want to move on to more advanced 386 based applications, like MS® OS/2.

Built-in VGA graphics give you beautifully detailed, high-resolution displays. Add a color analog monitor and create astonishing graphics using a palette of 256,000 colors for near-photographic clarity.

The 4000 SX's SmartDrive™ Integrated Drive Electronics (IDE) technology allows you to add high-performance hard

disk drives without the need or expense of installing a separate disk controller.

The new Tandy 4000 SX. From the best-selling family of PC Compatibles in America.

Send me a Tandy 4000 SX brochure.

It shouldn't  
matter how  
a computer gets  
information.

Information.

It comes in all shapes and sizes. And it can be found nearly everywhere you look.

Yet invariably, the information that's most needed is that which is least accessible.

Typically, it's distributed throughout the maze of mainframes, minicomputers, and file servers that your organization has acquired—systems in which it has a sizeable investment.

People are expected to navigate this labyrinth of systems in order to find the information they need to make timely, accurate decisions.

A daunting challenge, to say the least.

So how do people go about getting whatever information they need, whenever it is—and whenever they want it?

More important, how can they view the information in a way that makes sense to them? In a way that can help accelerate the decision-making processes they face every day?

As it turns out, the answer to those questions can be a remarkably simple one: Start with Macintosh®.

Because an Apple® Macintosh computer makes its power accessible to anyone who's willing to give it a try. And, when used in conjunction with the wide range of advanced applications available, it gives people the ability to do things they've never done before.

With Macintosh, people can concentrate on the task that needs to be done—whether it's drafting a memo, creating a presentation, or exchanging files over a network—instead of concentrating on the tool they're using to perform it.

Because Macintosh works the way people work.

It takes familiar, everyday items and applies them—in the form of on-screen icons—to personal computing. And it makes the computer's functions available through easy-to-use menus with terms that people can readily comprehend: open, copy, paste, print, save, quit, and so on.

As a result, many people have overwhelmingly accepted the way Macintosh enhances the experience of using a personal computer. Now they're extending their reach, looking to new sources for the information they need, and to existing sources for information in new forms.

With a Macintosh, you can have multiple applications and documents open at the same time. To work with the one you need, simply click on its window and the application becomes active. In addition, much of the information you work with can be copied and pasted between applications.

Using programs available today, it's possible to create information from the host can be displayed on the screen applications, including such features

And they're looking to Macintosh for help. Because it enables them to view all of those sources of information in a familiar, consistent way.

One of Apple's original objectives for the Macintosh was to make the technical complexities of computing completely transparent. We believed that most people didn't want (or need) to know how information got from one place to another, or how a document was printed—just as long as it did.

As Macintosh extends its reach beyond the desktop into other computing environments—Digital, IBM, OSI, and TCP/IP—our commitment to insulating people from technical complexities is also being extended.

Which leads us to ask an intriguing question: What if the information you need—no matter where it is—could easily be reached from your Macintosh and integrated with the applications you use, in a manner that is consistent with the way Macintosh works?

Those are the goals of Apple's networking strategy.

To make networking both simple and powerful, so people can access and use information more easily than ever before. And to make networking transparent to everyone on the network—whether they're down the hall, up the street, across the country, or on the other side of the world.

The networking and communications hardware and software products we describe in this brochure extend Macintosh computers into new areas, as well as allowing Macintosh to work in industry-standard and multivendor environments. This makes it possible to get information in ways you may already be familiar with—and in ways you never expected.

As these products become integrated into the environments for

which they were designed, they will enhance the way people work—individually and collectively. Because information that is available to them will appear when they need it, in the form that best suits their purpose.

And all they'll have to do, in classic Macintosh style, is point and click.

Because, when you get right down to it, getting the information you want—in a way you can use and understand—is all that really matters.

Today it's possible to develop applications that can take the data you work with every day and turn it into meaningful information that you can use in a variety of ways. Information can be integrated from a range of sources and displayed on any Macintosh computer.

# What you ne

Every Apple Macintosh computer has the "plug and play" capabilities provided by the AppleTalk® network system. This allows Macintosh computers to be used in any environment, from a small departmental workgroup to a high-performance, facilitywide internet.

Today there are more than 2 million AppleTalk nodes in use, making it one of the most widely installed network systems. And because the AppleTalk network system was designed in accordance with the same principles that Macintosh is based on, it's easy for organizations to install and support.

#### Apple TokenTalk NB Card

The Apple TokenTalk NB Card works with any of the computers in the Macintosh II family of systems; it allows

#### Apple Gase/Turmax Card

The Apple Gase/Turmax Card allows computers in the Macintosh II family of systems to be connected to an IBM

#### Apple EtherTalk NB Card

The Apple EtherTalk NB Card provides computers in the Macintosh II family of systems with direct connectivity to

#### Apple Serial NB Card

For computers in the Macintosh II family of systems, the Apple Serial NB Card provides flexible communications

One of the innovative features shared by the Apple Gase's, which combines an on-board 68000 microprocessor, many of communications protocols, freeing the main Macintosh

# eed to get the information you need.

AppleTalk offers two advantages that make it unique among network systems. It's easy to use, and you can easily build a flexible, powerful networking environment with it.

Because AppleTalk is a complete network system that offers the flexibility to choose the type of network that best suits your application. In fact, our latest version of AppleTalk, AppleTalk Phase 2, can run over LocalTalk™ cabling, as well as Token-Ring and Ethernet networks. And it will deliver the highest level of performance that the selected network can support.

The AppleTalk Internet Router allows you to improve the performance and manageability of an AppleTalk network system. It can be used to interconnect LocalTalk, TokenTalk™ and EtherTalk™ networks to form an internet. Which means that users can share files and printers, and send and receive mail, across the internet on the same way that they access those resources on a single network.

In addition to Macintosh systems, AppleTalk supports a variety of other environments, including Digital VMS™, UNIX, MS-DOS, and Novell NetWare.

But what hasn't gotten lost, in the flurry of acronyms that characterize the world of communications, is the underlying idea that networking doesn't have to be a lot of work.

In fact, when it comes to getting your network to work the way you expect it to, AppleTalk may be all your computers need to know.

them to connect to IBM and other IBM® S-compatible Token-Ring networks. And because the card supports a variety of network protocols (including AppleTalk, S270, 11/6, and SMD), it can be used to access local area network services and mainframe-based services. The TokenTalk NS Card includes TokenTalk software, which implements AppleTalk support for AppleTalk Phase 2 networks and brings AppleTalk services (such as access to

LocalWare® printers and AppleShare® file servers) to Macintosh computers connected in a Token-Ring network. The card can also be used with MacLPT software to access mainframe-based applications and data, as well as with the Macintosh SMD File Transfer Utility to transfer files to and from an IBM PC LAN server on the network.

SNA network at S270 Information Display Systems using industry-standard coax cabling. This capability allows users to access mainframe-based applications and data from a window on the Macintosh screen just as they would from a standard terminal. When used with MacLPT™ software, the Apple Card/Printer Card can support single-session Control Unit Terminal (CUT) emulation or up to five-session Distributed Function

Terminal (DFT) S270 emulation. Data can be transferred to and from mainframes (running VM/CMS or MVS/TSO) using the IBM INTRVL package, as well as through the Macintosh Clipboard via standard "copy" and "paste" operations. And MacLPT can be used to assign functions keys on the Macintosh keyboard to functions in S270 applications.

10/2-3 Ethernet networks (it can be used either with three coaxial cables, or with thick coaxial or twisted pair cable using external transceivers). And it allows connected Macintosh systems to be used with a variety of networking protocols, including AppleTalk and TCP/IP. Included with the Apple EtherTalk NS Card is EtherTalk software, which implements AppleTalk support for AppleTalk Phase 2 networks and allows Macintosh users on the network to

access network services (printers, file servers, and other resources). The card also works with Mac™ software: a display server that supports the X Windows protocol and runs in a window on the Macintosh desktop.

options. It comes with four serial ports that can be configured for use as RS-232, RS-422, X.21, or V.35 communications ports. And when it is used with MacAPPC™ software, the Apple Serial NS Card provides SMLC connectivity to SNA environments. MacAPPC gives programmers the necessary software tools to write applications that support distributed communications services between Macintosh and 11/6, 2-based systems.

connected to an SNA network. That more important, it provides them with the tools they need to give people access to mainframes via the Chooser, the standard Macintosh interface for selecting the server, printer, and other resources. The Apple Serial NS Card is also the platform for the MacL2S™ server, which gives users on an AppleTalk network transparent access to host services over X.25 packet-switched data networks.

Apple Card, the Apple TokenTalk NS Card, and the Apple Serial NS Card is the Macintosh Coprocessor Platform™, an operating system. For those NuBus™ cards, this "middleware" design supports the independent execution of processor from those tasks and allowing it to concentrate on other applications.

# Why you should on our latest d

CL/1

In any networking environment, the most important connection that must be made is the connection between the individual and his or her computer.

And in keeping with the tradition of Macintosh, we're offering tools that developers can use to customize their applications, giving them the look and feel that has come to characterize Macintosh applications.

For example, there's CL/1™, a complete connectivity language based on the client/server model. CL/1 gives

Mac W

developers the ability to build applications that provide transparent access to multivendor SQL database management systems in the IBM and Digital environments.

We also offer MacWorkStation™ software, a development tool that allows programmers to modify host applications so that when they are run from a Macintosh, the applications present a graphical interface to the user. MacWorkStation gives developers access to menus, dialog boxes, and other features that are characteristic of the Macintosh interface.

that provides standard access to data connections, terminal emulators, and file transfer protocols.

And that just might be the most significant development of all.

Finally, to facilitate the development of consistent Macintosh communications applications, we offer the Macintosh Communications Toolbox, an extension of the system software

# How to get what's coming to you.

*When evaluating Macintosh,  
there are two subjects  
you should consider*

Just a few short years ago, AppleTalk made networking Macintosh computers a snap. Literally.

Today, not much has changed—except for the number of ways in which Macintosh and AppleTalk can help you when it comes to making the right connection.

To find out how well connected Macintosh can be, contact an authorized Apple reseller or representative to arrange for a presentation.

You may also be interested in learning how these products integrate with our family of systems via Apple's Open Architecture System Integration Strategy. Call 1-800-446-3000, ext. 600, to receive a brochure that outlines the design features that make Macintosh unique.

Once you've made those connections, you'll understand precisely what Macintosh is coming to.

And why so many people are coming to Macintosh.

## THE PERSPECTIVES CONFERENCE

Computerworld Perspectives  
is the Executive Conference on  
Strategic Information Management  
designed to give you & your company  
answers on Strategies, Productivity & Standards.

This conference confronts the critical issues facing your IS team.  
Be prepared for the future. Join us.

June 20-21 New York City

Conference topics include:

Multi-vendor Integration, The State of Expert Systems,  
Network Management, Software Solutions, Security,  
Decentralization vs. Centralization, The Value of IS Investment,  
The Dollars and Sense of Downsizing, MIS as a Profit Center,  
The Office of the Future, MIS in the 1990's, The Customer as  
Partner, The Role of the Mainframe in the Future,  
Global Networking, Legal Options and Issues for IS

Featured speakers include:

Shoshana Zuboff, Michael Hammer, Donald Burr,  
Larry DeBoever, Ed Mahler, Tom Malone, Vaughan Merlyn,  
Donn Parker, Dr. Larry Harris, Ron Brzezinski, Tom Donovan,  
Bill Dunn, Mike Sullivan-Trainor, Stewart Brand, Charlie Lecht,  
Richard Bell, John Fisher, Jack Bologna, Dave Van Lear,  
Bill Howard, Mike Kaminski, John Burton, Larry Chimierine,  
Hank Jones, Robert Badal

Call Rhonda Radliff for further information at  
(508) 935-4565 or (508) 875-5000, Ext. 4565

Conference attendees are also invited to the  
Computerworld Smithsonian awards presentation.

Integrage Corp. has announced a version of its Microstation Cadd software developed specifically for Apple Computer, Inc.'s Macintosh environment.

Dubbed Microstation Mac, the package reportedly offers graphics database compatibility with other Microstation versions and an interface to Oracle Corp.'s Oracle relational database manager for nongraphic data. Other features include reference files, three-dimensional capabilities and on-screen menus. A Mac II, Mac IIX, Mac ILCX or Mac SE/30 is required. Scheduled for availability in July, the software will carry a price tag of \$3,300.

Prism Corp. has introduced a series of 394-in. internal disk storage systems that are reportedly targeted for desktop applications in the Intel Corp. 80286- and 80386-based computer marketplace.

The 43M- and 45M-byte storage systems feature a 28-msec access time, shock isolators and automatic head park and lock capabilities, the company said. Each unit reportedly includes a tested and

formatted Winchester 394-in. drive, mounting hardware, cables, partitioning software and an instruction manual.

The ID45T-AF 43M-byte device features an IBM Personal Computer AT interface and is priced at \$720. The 45M-byte ID45T-SC is said to include a small computer systems interface and is priced at \$1,070. Several other drive configurations are also available in the series.

**Prism**  
20 W. Montague Expressway

408-434-9300

A desktop-configured mass storage device has been announced by MDB Systems, Inc.

The Data Shuttle 1000 shock-protected removable canister reportedly contains switch-activated wire protection and was designed for the personal computer and workstation environment. The unit contains any 54-in. form factor device with capacities from 56M to 760M bytes interfaced with a small computer systems interface. The Data Shuttle 1000 chassis costs \$1,195, empty disk canisters \$485 and removable canisters \$600, the company said.

### Board-level devices

Hauspauge Computer Works, Inc. has announced a 25-MHz Intel Corp. 80386 motherboard upgrade for IBM Personal Computer ATs and compatibles. The replacement board reportedly features 64K bytes of zero-wait state cache and 4M bytes of 32-bit main memory. The board is priced at \$4,495.

The company also announced price reductions on three of its major products. The 386 PC/Motherboard and XT/Motherboard units have each been reduced from \$1,695 to \$1,595, and the 386 AT/Motherboard has been cut from \$1,795 to \$1,595.

**Hauspauge Computer Works**

Hausepauge, N.Y. 11788  
516-434-1600

Connect Computer Co. has announced a dual-slot expansion unit for Toshiba America, Inc. T1200, T1600, T3100 and T3100 portable computers.

The Wisunder II extends the capabilities of the laptops by letting users add two standard full-size personal computer expansion cards. The product supports Ethernet, Token-Ring and other networking environments and costs \$479.

**Connect Computer**  
9885 W. 78th St.  
Eden Prairie, Minn. 55344  
612-944-0181

A 16-MHz Intel Corp. 80286-based motherboard with built-in monochrome graphics has been introduced by DTK Computer, Inc.

The PTM-1660C provides a floppy disk controller, a 16-bit AT bus header and an IBM Personal System/2-like keyboard mouse port. Two serial ports and one parallel port are included in the vendor said. The unit is priced at \$725.

## A STEP AHEAD OF EVOLUTION

Survival of the fittest — that's what evolution is all about. To make sure that UDS modems are fit to survive, we submit every one to a hellish 24-hour test regime. That's how we weed out the weaklings.

During the testing, each modem is cycled between 0°C and 50°C. There's a one-hour "soak" at the first temperature extreme, followed by a 30-minute transition to the other. After a one-hour pause, the

cycle is reversed — and repeated — for 24 grueling hours.

Only the survivors get shipped. That's why UDS boasts a DOA rate of only 0.5%, compared with an industry average in the 2-5% range.

Despite claims of rigorous modem testing, many other manufacturers simply turn their modems on for a while. Now you know where the 2-5% average comes from!

For top reliability in your data-comm system, stick with modems from UDS. You know they're the fittest — they've survived!

# WE CAN TAKE SOMETHING THIS COMPLICATED,

O'Hare Industries

Memorandum

From: Dave O'Hare  
To: Alfred  
Re: Tucson Office

Alfred:

Need to put Tucson on the network.

At 3Com, we're the only company that can take to more types of systems than anyone else. Even systems you never planned on networking.

Like the two dozen UNIX workstations that suddenly appeared after the last reorganization.

Or the 100,000 lines you've added without adding to your company's basic message.

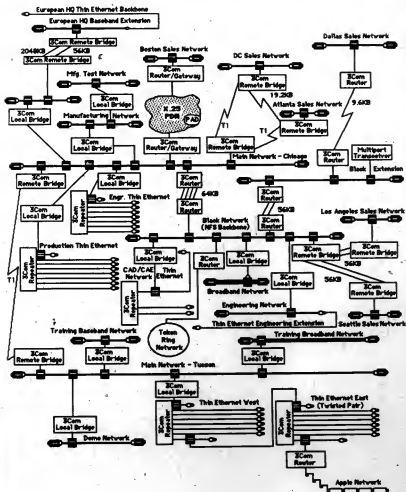

How does 3Com do it?

Well, for one thing, we make more modular networking products than anyone else.

Our modular architecture lets us connect our operating systems to servers, bridges, and gateways. So you can comfortably adapt to a changing environment.

And if you want, you can build upon a platform.

# AND SIMPLIFY IT.

# FACE THE FACTS

Enter/3270 is a registered trademark of International Business Machines Corporation. SQL\*Star is a registered trademark of Oracle Corporation. Archie is a registered trademark of Tympan Systems. SAA/SCUA is a registered trademark of Ciba Corporation.

## MULTI SOFT'S SUPER-LINK®

Family gives you SAA/SCUA now, without mainframe coding!

INFRONT/DS™ (Development System) is a complete, PC-resident developer's toolkit, including an intelligent screen management subsystem, a 4GL, with a source code debugger, and a PC-resident data base, with a series of data base maintenance utilities. INFRONT/DS™ allows a developer to add new functions and a PC-resident SAA/SCUA-compatible front-end to existing HOST applications without changing any mainframe code.

INFRONT/RT™ (Run-time) is the run-time software that allows INFRONT/DS™ applications to run 'in front' of standard, 3270-based mainframe applications. With INFRONT/RT™ data is exchanged between the PC and mainframe by using the 327X screen image as the communications medium. INFRONT/RT™ supports a wide variety of 327X emulation interfaces including the IBM API (HLAPI and low level API), IRMA cards, and LAN gateways which account for over 90% of the installed base of 327X emulation cards and software.

INFRONT/HPO™ (Host Processing Option) extends INFRONT/RT™ into the development of peer-to-peer cooperative processing applications. INFRONT/HPO™ provides the cooperative processing capabilities of IBM's APPC (Advanced Program-to-Program Communications) product for PC host applications. However, instead of requiring the use of LU6.2 SNA sessions, INFRONT/HPO™ executes over the LU2-based networks that are already in place. INFRONT/HPO™ uses INFRONT/DS™ to create PC forms. This allows all INFRONT™ forms to be completely portable between the screen-based communications of INFRONT/RT™ and the peer-to-peer protocols of INFRONT/HPO™.

SDF™ (Software Distribution Facility) is an INFRONT/HPO™ application that brings the distribution of PC software and files under the programmatic control of the host, and provides a mechanism for ensuring that all users of standalone and cooperative processing applications are using the correct versions of all programs, forms, files, and tables.

INFRONT/BCF™ (Background Communication Facility) provides an API (application program interface) for PC programs that allows them to communicate with an IBM host on a file-by-file or record-at-a-time basis. Communications between the host and PC can take place on a real-time basis, or in a background mode where the communications process can execute as a background task managed by INFRONT/BCF™. This background task is implemented in a standard MVS/DCS environment and allows any DCS program to run in the foreground. The foreground and background tasks can be completely unlinked.

## DATA STREAM

Elisabeth Horwitt

### But is it a front end?

Will someone please give me a working definition of "front-end processor"? How does it differ from or relate to that even more nebulous processor?

IBM-compatible host front-end processors used to be easy to mail down. You had a three-vendor market — IBM, NCR, Conden and Amdahl. You had a fairly finite set of functions having to do with coordinating communications to the host from multiplexers, local-area networks, modems and the like. Except that everyone, including IBM, is twisting the traditional front end's definition like taffy. IBM announced PU2.1 support for host/front-end Systems Network Architecture software NCP and VTAM. Then it announced better X.25 support. And then it boosted up its high-end front end, the 3745, to support multiple T1 lines. The result: a front-end processor that doesn't necessarily "front end" a host at all. Instead, it acts as a node in a peer-to-peer SNA backbone, passing on PU2.1 and X.25 communications to other nodes and on.

## Network on trial

Heinz lawyers test a link for company's offices

### ON SITE

BY RICHARD PASTORE  
OF STAFF

PITTSBURGH — Approximately 30 H.J. Heinz Co. corporate attorneys are cross-examining a pilot project combining local- and wide-area networks linking four of the company's law offices. The firm is banking on saving as much as \$500,000 a year by using the system.

The network will link Heinz world headquarters here with Heinz U.S.A. on the other side of

the Allegheny River, as well as with two subsidiaries: Star-Kist Foods, Inc. in Long Beach, Calif., and Weight Watchers International, Inc. in Jericho, N.Y. If all goes well, the system will be fully implemented in September, according to Larry McCabe, vice-president and associate general counsel.

The configuration includes 50 Data General Corp. Dash/286 IBM-compatible workstations linked by DG's PC1 network, a Netbios and Microsoft Corp. MS-Net-compatible Ether-

## Fax boards copy stand-alone gains

BY ELISABETH HORWITT  
OF STAFF

PARSIPPANY, N.J. — Facsimile systems will become just one more communications board on the IBM Personal Computer family of micros. This is one important factor behind a market explosion that will add another million units next year to the 1½ million fax systems installed today, according to a recent study by The Eastern Management Group.

Other major factors include an expected plunge in prices and improved technology, said the research firm, based here.

PC fax boards will increasingly supplement stand-alone fax machines currently installed in corporate communications centers and mail rooms, Eastern Management said.

### Sales crescendo

PC facsimile boards are expected to keep a steady beat on their climb to sales of 225,000 units in 1991

Such boards will become integrated with other PC-based communications systems, which include modems, electronic mail and perhaps voice-messaging technology, according to the study.

Higher transmission speeds, better quality transmissions and decreased costs — not only in fax machines and boards but also in long-distance lines — have helped boost fax machine sales in the past few years, the research firm said.

Future developments that will further help the market include the availability of Group 4 fax machines, which transmit a page in less than

10 seconds over 64K bit/sec, private digital telephone lines and Integrated Services Digital Network links.

In comparison, it takes the older Group 3 digital fax machines approximately one minute to transmit a page over public switched telephone networks.

Priced at between \$8,000 and \$15,000, Group 4 faxes are also said to provide much clearer images than other types of faxes.

Another development that will drive the future market is

New Version!

## Zero Learning Curve SPF/PC® 2.1

The MVS programmer will feel right at home using SPF/PC, the only PC editor functionally equivalent to editing on the IBM mainframe with SPF/PDF, Release 2, Version 2.

SPF/PC fills the mainframe user's needs with a familiar environment, commands, large file support and micro-to-mainframe file portability. SPF/PC also offers:

- true split screen
- directory/member lists
- command stacking
- hexadecimal editing
- 43-line EGA
- 50-line VGA
- picture strings
- user interface
- online help
- utilities
- binary editing
- network support

SPF/PC includes many PC-productivity features to save time and keystrokes, such as direct access to BROWSE and EDIT directory lists from the DOS prompt.

Want proof? Ask us for a **FREE** interactive demonstration diskette.

SPF/PC — so much like the real thing, you'll forget you're editing on a PC.

# Net vendors roll out AS/400 red carpet

BY PATRICIA KEEFE  
CIRCUIT

Communications vendors are rushing to open up their product lines to embrace IBM's Application System/400.

Five recent product announcements cover the gamut of AS/400 connectivity options:

- Following an announcement by Joiner Associates last month, Forest Computer, Inc. in Okemos, Mich., has announced plans to ship Connection System, an AS/400-to-Digital Equipment Corp. Decnet link, in July.

- Novell, Inc.'s Communications Products Division has introduced Netware support for the AS/400. The Netware 5250 Twinax Workstation provides personal computers with AS/400 and IBM System/34, 36 and 38 terminal emulation.

- Emerald Technologies, Inc. in Bethel, Wash., said its remote 5250 emulation products for PCs and Personal System/2s now provide access to IBM's AS/400 PC Support.

- Biocom, Inc. in Billerica, Mass., has unveiled Fax400, a multiuser automated facsimile delivery system for the AS/400. It includes a front-end processor — the Faxcom 1000 Plus — and AS/400-based host software developed by E.D.S. Computer Services in Marlboro, Mass.

- Gammalink has announced a combination of IBM software and Gammalink hardware to provide fax service for existing IBM VM, MVS and AS/400 environments and OfficeVision.

Forest said Connection System is a turnkey system that does not require third-party software on the DEC or IBM systems. The initial release will accommodate a bidirectional file transfer between the AS/400 and DEC VAX equipment. The product will be available in the fourth quarter; pricing starts at \$24,000.

On the IBM side, Connection System uses an LU6.2 transport into the AS/400's Distributed Data Management file access facility. Connection's hardware interfaces to IBM via a Token-Ring link. Logically, it will appear as another AS/400.

On the DEC side, Connection will use a standard Ethernet interface into Decnet, emulating a Decnet end node. Connection also interfaces to Decnet's File Access Listener using the Data Access Protocol.

Fortcoming releases of the system will include virtual 5250 and VT220 terminal sessions for release in the fourth quarter; an LU6.2 programmatic interface between IBM and DEC slated for release in the first quarter of 1989; and an IBM Systems Network Architecture Synchronous Data Link Control attachment to IBM, also scheduled to ship in the first quarter.

The Netware 5250 Twinax Workstation replaces Novell's POX/5250 Twinax software, which will be phased out. It provides device emulation and application support for IBM's midrange, excluding the 9370. The new software costs \$250 and requires Novell's Twinax Adapter card, which costs \$545.

This first piece of AS/400 connectivity will be bolstered by plans to provide a Token-Ring gateway to the AS/400 and a local, twin-axial gateway support for the AS/400 and System/34, 36 and 38, said

Jerry Machi, Novell's director of product marketing for communications products.

The final step will be moving Netware onto the AS/400, a move Machi said is at least a year away. The lack of an AS/400 C compiler is all that stands in the way of moving Portable Netware to IBM's strategic midrange computer, he added.

Emerald couples its 3XMate or 3XPlus with its new AS/400 PC Support remote adapter handler software, which acts as a bridge to allow the use of all versions of PC Support, to eliminate the 5394 controller. Customers using Emerald products to connect to System/34, 36 and 38

hosts can migrate their investment to the AS/400, the vendor said.

The AS/400 PC Support software is now standard with all Emerald products. For a limited time, software upgrades are free for current users by calling Emerald.

Both Novell and Emerald are playing catch-up with Billerica-based Iddemco, Inc., which has been shipping a 5250 gateway connecting to the AS/400 or the System/34, 36 and 38 for more than two years.

That product was upgraded in March, Gateway Plus provides users with three options, said Cathy Rithimio, Iddemco

product manager for midrange communications products. It connects PCs on a LAN to either host system, provides similar connectivity for non-networked PCs linked to a server or gateway via serial cable and connects remote PCs through asynchronous modems. The software costs \$1,295, and the board is priced at \$645, Rithimio said.

Biocom's Fax400 reportedly allows any AS/400 user to transmit documents from the desktop direct to any Group III fax. Fax36 users can upgrade to Fax400. System pricing is approximately \$6,800. IBM has selected Gammalink to supply the fax boards needed for its Office Facsimile Application, announced at last month's Systems Application Architecture introduction.

# Netlink, Jupiter orbit into networked processors arena

BY ELISABETH HORWITT  
CW staff

Two recent product introductions in the communications processors arena are designed to increase the network flexibility, efficiency and effectiveness of existing hosts and servers.

Netlink, Inc. in Raleigh, N.C., announced Netlink Branch Information Gateways, based on its existing SNA Hub product. The Hub is typically used as a

front-end processor for multiple IBM Systems Network Architecture (SNA)-compatible hubs, but unlike an IBM front-end processor, which can only provide direct access to a classic SNA mainframe, the SNA Hub also provides direct access to IBM Application System/400s, IBM System/86s, Tandem Computers, Inc. hosts and other systems "that don't exactly fit into the SNA structure," according to Rod Starrett, Netlink manager of OEM sales.

The Branch Information Gateways make use of another Hub feature: the ability to act as a concentrator for downstream devices such as local-area networks, multiplexers and application processors, allowing multiple applications and services to share the same line to the host, Starrett said.

Netlink will initially target the gateways at banks, which typically must keep adding application processors at various branches, to support a variety of new services, Starrett added. Without the gateways, banks must install a new line to the host at each branch for each new service, increasing communications costs and requiring that the SNA network topology be redesigned each time, according to Starrett. The gateways allow multiple applica-

**N**ETLINK WILL initially target the gateways at banks to support a variety of new services.

ROD STARRETT  
NETLINK

tions, processors and even lines from different branches to address an IBM host as a single SNA Physical Unit, or PU, so that additional services require no network redesign or new host lines, he added.

The new Branch Information Gateways provide support for point-to-point terminals and are priced at \$7,000, \$3,000 less than the Hub, with volume discounts available, so that companies can justify installing them as concentrators at multiple remote sites, Starrett said.

Another host front-end vendor, Jupiter Technology, Inc. in Waltham, Mass., has introduced support of the Transmission Control Protocol/Internet Protocol (TCP/IP) networking standard for its System 1000 and System 100 data communications computer systems.

The multiprocessor systems are said to use a proprietary, modular communications software environment, Softlink, to provide connections among a variety of computer systems and over a range of networking environments, including asynchronous lines, X.25 packet-switched networks and SNA systems.

Jupiter's communications platforms can now connect TCP/IP to non-TCP/IP systems and include security features, the firm said. Available now, the TCP/IP software package is priced starting at \$3,000.

For an educational institution, nothing is more important than the smooth exchange of information. That's why many colleges are making information networking a top priority.

The toughest challenge is connectivity. Colleges and universities, like most places, acquire computers and telecommunications hardware in patchwork fashion, ending up with little or no compatibility.

For one northeast college,

AT&T Network Systems, working with the local telephone company, demonstrated that ISDN was the solution. Their information services manager explained: "ISDN gave us the best capabilities for the least cost. And we didn't have to trash our existing systems."

With central-office-based ISDN, ordinary phone lines become the links in a fully interactive network. This translates into many applications and benefits. Voice and data can be transmitted simultaneously. For example, students and professors can confer with the Dean, who has on-line access to student records. Electronic mail streamlines internal communication, so course enrollment changes can be posted immediately. PC terminal access to host computers and electronic file transfer extend every user's access to sophisticated software and multiple databases.

As the college's manager puts it: "ISDN can revolutionize the education experience. It's going to make us a better college. And, bottom line, a more competitive college."

"Our college needed to enter the Information Age. But we weren't sure we could afford the price of admission."

## The Future's on the Line.

This college is just beginning to tap ISDN's potential. At AT&T, we believe this potential goes beyond today's need for improved communications to pave the way to a larger vision—Universal Information Services—a world of services on demand.

For more information, call the AT&T Futureline, 1-800-638-7978, ext. 0310

# AT&T links gather support from a variety of vendors

Case/Datatel, Inc. is the latest vendor to announce plans to support AT&T's Unified Network Management Architecture (UNMA). UNMA-compatible interfaces will be available on all Case/Datatel console-controlled products, including model processors, network management systems, statistical multiplexers, modems and packet-switching devices.

Timesplex, Inc. announced that its Link/2 T1 switch has been tested and approved by AT&T for use with the carrier's recently announced Accurate Spectrum of Digital Service, including fractional T1 services. Timesplex said, AT&T's fractional T1 services are said to support transmission rates in bundles of 128K, 256K, 384K, 512K and 768K bit/sec. Racal-Milgo, Inc. has also announced support for AT&T's fractional T1 service through its Omnibus line of multiplexers.

AT&T recently signed agreements to form a strategic alliance with major Italian telecommunications equipment manufacturer Stetel. Under the agreement, the two vendors will develop, manufacture and market telecommunications equip-

ment in Italy and throughout the world. AT&T will purchase a 20% interest in Stetel.

Banyan Systems, Inc. has unveiled the IBM environment in which you really get bogged down in overlapping and dovetailing functions. Vendors seem to feel that "front-end processor" is a good thing for a product to be, so we're seeing all kinds of announcements introduced under the title. Able Computer just announced a "front-end processor" whose main purpose is to boost the line capacity of a Decserver. A useful device, but a far cry from the kind of product described above.

Of course, only IBM hosts really rely on their front ends to coordinate communications for them; everyone else could technically get along without. To avoid clouding the issue, let's keep the term "front end" for everything that sits in front of, and enhances the networking functions of, a host. Such devices can be called communications processors, systems, modules, platforms or just plain black boxes. The point is that while they rarely — if ever — meet

## Horwitt

To avoid clouding the issue, let's keep the term "front end" for everything that sits in front of, and enhances the networking functions of, a host. Such devices can be called communications processors, systems, modules, platforms or just plain black boxes. The point is that while they rarely — if ever — meet

the classic IBM definition of a front end, they still perform important "front end" functions.

For example, the channel-based host network has come a long way from the first proprietary boxes to connect two IBM hosts. Added capabilities introduced by Intel, Computer Network Technology, Network Systems and others include the ability to number a greater number of hosts; multivendor host support, often through agreements with software companies such as Plexidex; and support of network standards such as Ethernet and Fiber Distributed Data Interface.

That last item is important if you insist that a front-end processor must address user-to-host — not just host-to-host — connections. The Ethernet support particularly provides a cost-effective way for user workstations to hook into a channel-based network backbone, which typically costs \$50,000 or \$100,000 per connection.

Then we have Jupiter Technology's System 1000, Computer Communications' Data Express and Northern Telecom's Meridian Data Networking System — all extremely difficult

to categorize but all multiprocessor, multi-systems that are designed to link a variety of hosts to each other — and also to workstations and LANs — over remote T1 and X.25 links.

To further confuse the issue, we have Netlink, Inc., a company that lives literally in IBM's shadow (in Raleigh, N.C.) and was formed largely from former IBMers. Netlink's SNA Hub acts as a front end in the sense that it provides more flexible links between downstream device servers (Series/11, multiplexers, modems and LANs) and multiple SNA-compatible hosts. It also acts as a concentrator, allowing multiple device servers and applications to share the same line to the host.

Maybe the idea of piling down front-end processors to a specific definition is not such a good one. I would rather praise third-party vendors that do the risky but important job of staying a step or two ahead of IBM and DEC — and hopefully prodding those big guys into enhancing their own communications products a little faster.

Horwitt is a Computerworld senior editor, networking.

## Heinz

FROM PAGE 49

net LAN. These are linked to four DG MV/2500 DC host superminicomputers, one in each of the four corporate law offices.

The MV/2500 DCs, which feature 644M bytes of disk storage and either 16M or 24M bytes of memory, are tied together by a DG Ethernet LAN system customized for the Heinz installation.

The superminis communicate with one another and the workstations via DG's X.25 Xodac transport system. All are connected by a LAN/WAN bridge from Microcom, Inc. in Norwood, Mass.

The network is completely transparent, allowing attorneys at one site to access data at another as though the offices were in the same building and linked by LAN, McCabe said.

"We have a lot of need to communicate," McCabe said. "Before, this was done by telephone, fax, couriers and a great deal of travel." The only computers previously used by Heinz attorneys were stand-alone Wang Laboratories, Inc. word processors and a few Apple Computer, Inc. Macintoshes, all of which will be ousted by the DG hardware.

Heinz expects the network to pay off in reduced travel and paper generation, among other costs, to the tune of \$200,000 a year. The increased productivity and newly gained access to outside databases such as the West-law legal database will cut expenses

on outside legal services by as much as \$300,000, according to Heinz projections.

"The way we have designed the entire system, we'll be able to have much better control over the management projects," McCabe said. For instance, he

**T**HE WAY we have designed the entire system, we'll be able to have much better control over the management projects.

LARRY MCCABE  
R. J. HEINZ

said, "Right now two of our offices are involved in trademark litigation." When the network is fully implemented, "both offices will be able to review filings in those cases and transmit the

data and documents back and forth much more quickly than now," he said.

Currently, the offices can print from one Wang word processor to a printer in another building via dial-up lines. But McCabe said this capability was seldom used because of its relative complexity and slowness.

The technology selection took more than six months, with McCabe and consultants from Coopers & Lybrand setting the criteria. Heinz's needs included improved document preparation, revision and flow; support and tracking of litigation analysis; access to outside databases; and an improved word-filing system.

Data General "had a good package that met our needs and was able to provide the kind of support we need," McCabe said. The legal application software was supplied by Orca, Utah-based Softsolution Corp., an Authorized Data General System Distributor.

## Fax boards

FROM PAGE 49

the ability of PC, electronic mail and telex systems to send and receive faxes via network service vendors. MCI Communications Corp. has already announced such a service, according to Eastern Management.

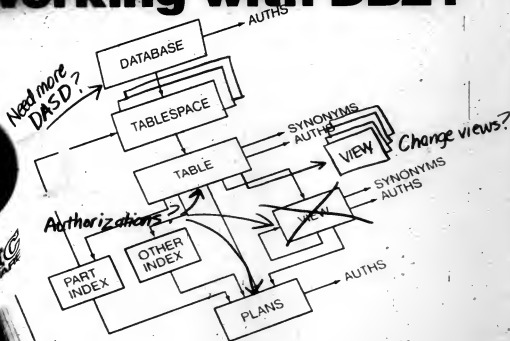

Future market revenues will not match the increase in unit sales, primarily because the average cost of stand-alone fax terminals will drop dramatically and

because low-price units will represent the larger proportion of sales, Eastern Management said.

Total facsimile unit sale revenues will rise from \$1.4 billion in 1989 to \$2.1 billion in 1992, the study predicted.

PC fax boards, which sold last January at between \$300 for 4.8K bit/sec. machines and \$600 for 9.6K bit/sec. machines, should drop to \$150 to \$200 by next January, the market research company predicted.

# Working with DB2?

## Work with BMC

DB2 can be a lot more work than you expected with quite a bit less help than you need. But when you've got BMC Software's comprehensive set of DB2 products—which includes standard interfaces and integrated functions—you can reduce your costs and make your work fast, easy and error-free.

**DB2 MASTERMIND™**—complete DB2 administration in one product\* consisting of:

**DB2 ALTER**—provides complete support for changing, copying and migrating DB2 data structures: includes data conversions, authorization-id switching and restart capabilities.

**DB2 CATALOG MANAGER**—gives quick and easy catalog information, execution of SQL, DDL and DB2 utilities, audit logs and extended SQL function.

**DB2 DASD MANAGER**—controls the life cycle of physical objects with comprehensive space estimation, AMS command and utility jobstream generation, and action triggers.

**DATA PACKER™/DB2**—reduces DASD requirements for DB2 tables an average of 50% to 70%; reduces EXCPs.

**DB2 REORG PLUS**—reorganizes DB2 tables 4 to 10 times faster than the supplied DB2 utility; provides dual image copy and statistical history.

For more information or to begin a 30-Day-Plus Free Trial of any or all of these products, complete and return this coupon, or call BMC Software, Inc., **The Complete DB2 Company™**.

**Local-area networking hardware**

A line of Unix-based desktop network servers has been announced by Motorola, Inc.'s Computer Systems Division.

The Delta Series 3000 Model 3200 network servers are based on the company's 68030 processor and reportedly deliver clock speeds of up to 25 MHz.

The systems accept up to three Motorola VMEbus cards each and come with up to 12 serial communications ports and one parallel port, the vendor said.

Pricing ranges from \$7,495 to \$19,785, depending on configuration and amount of storage desired.

**Motorola**  
10700 N. De Anza Blvd.  
Cupertino, Calif. 95014  
408-964-4480

A combination hardware and software product that reportedly permits access to Ashton-Tate Corp. dBase format files residing on a local-area network via a Touch-Tone telephone has been announced by the Automated Group, Inc.

Voicebox Version 1.1 is a remote database inquiry manager system that integrates telephone, digitized speech, text-to-speech and database technologies into a single user interface, the vendor said. The product runs on dedicated Intel PCs, 80286- or 80386-based AT bus-compat-

ible workstations connected as nodes on the network. The Version 1.1 software with the two-board hardware package is priced at \$4,995.

**The Automated Group**

Roswell, Ga. 30077  
404-936-0407

**Local-area networking software**

Softkone Distributing Corp. has released a Microcom Networking Protocol (MNP) Level 5 add-in module for use with its Mirror III personal computer data communications software package.

Designed for MS-DOS PC users, the add-in product offers support for the MNP at Levels 2, 4, and 5 and enables Mirror III to communicate with other MNP-equipped remote systems. The module is priced at \$31.95. Mirror III costs \$99.95. Pricing does not include shipping and handling charges.

**Softkone**  
Suite 100  
327 Office Plaza Drive  
Tallahassee, Fla. 32301  
904-678-5564

Thomas-Conrad Corp. has introduced a software package designed to assist local-area network administrators in analyzing the performance of their networks and di-

agnosing problems.

Called TXD, the program reportedly operates under Novell, Inc.'s Netware Version 2.1 or higher and is scheduled for delivery in the second quarter. The product analyzes traffic-volume performance and identifies potential hardware failures, the vendor said.

It will be priced at \$195.

**Links**

NBI, Inc. has added three network file and application servers to its line of networked computer systems.

The servers are based on AT&T's Unix System V, Release 3.0 operating system and include NBI's Officeworks

networking and information management software package. The entry-level NBI 505 server can support as many as 32 IBM Personal Computer AT-compatible computers, Apple Computer, Inc. Macintosh machines or Unix workstations.

The NBI 505 is available in 64- or 128-unit versions, according to the vendor. The unit supports up to four 5 1/4-in. disk drives and has nine VME-standard expansion slots. The NBI 580XD reportedly provides a maximum disk capacity of 3.5M bytes and offers eight VME-standard expansion slots. The units are priced from \$18,800 to more than \$46,500, depending on configuration.

Mika, L.P. has announced Whisper, a communications hardware and software product designed for personal computer-based data security.

The product works over ordinary phone lines using Hayes Microcomputer Products, Inc.-compatible modems, the vendor said. It reportedly blends the Data Encryption Standard with communications features such as file transfer and terminal emulation and includes menu-driven software and a hardware-encryption module. The product supports Xmodem, Ymodem, Kermit and Zeta file-transfer protocols, the company.

Whisper costs \$395.

**KEDIT 4.0**  
**XEDIT COMPATIBLE PC EDITOR**

KEDIT™ is a text editor for DOS and OS/2 that supports most commands and features of XEDIT, IBM's editor for VM/CMS. But KEDIT goes beyond XEDIT compatibility with special PC-based features for a first-rate combination of mainframe power and PC flexibility.

- More than 100 XEDIT compatible commands and SET options, including the ALL command
- XEDIT prefix commands, targets, and fullscreen layout.
- Multiple files, multiple windows.
- Built-in subset of the REXX macro language included.
- Interfaces to Personal REXX, our complete implementation of REXX.
- Enhanced block operations.
- And much, much more.

KEDIT is a trademark of the Mansfield Software Group, Inc.

Control Data Corp. has announced a series of network servers designed to provide file and compute serving for workstation users, the company said.

The Cyber 920 systems reportedly offer single and multiple reduced instruction set computing processor models for distributed processing functions and are aimed at users in the automotive, aerospace and research industries.

The single-processor, 16.7-MHz Cyber 920-161 and dual-processor, 16.7-MHz Cyber 920-162 are priced at \$25,745 and \$54,900, respectively. The two-processor, 25-MHz Cyber 920-252 and the four-processor, 25-MHz Cyber 920-254 are available now. The 920-252 will cost \$74,900, and the 920-254 will carry a price tag of \$99,900, according to the vendor.

### Customer-premises equipment

Northern Telecom, Inc. has announced the Centrex Integrated Services Digital Network (ISDN) Display Set, the MS209T.

The set is the latest addition to the company's line of Meridian 5000 series business sets and is available as a voice-only terminal or with either of two options that provide data services, the vendor said. One option reportedly provides packet service over the D channel at 110 through 19.2K bit/sec.

The second allows the user to choose between packet data over the D or B channel circuit-switched data at 110 through 19.2K bit/sec.

Scheduled for August availability, the Centrex ISDN Display Set will be priced from \$435 to \$540.

Northern Telecom  
4001 E. Chapel Hill  
Nelson Highway  
Research Triangle Park, N.C.  
27709  
919-992-2788

Wang Information Services Corp. (WISC) has announced two products designed to complement its DVX-II voice processing system.

The WISC Mail User Interface converts Digital Sound-based voice-mail system prompts to the interface used by Wang Laboratories, Inc., the vendor said. In addition, DVX-II can now be connected to Wang's traditional DVX voice-mail product via analog networking. WISC Mail runs on any model of the DVX-II system and is priced at \$906.

The analog networking software is scheduled for delivery this month and will carry a price tag of \$1,725 per DVX-II node.

WISC  
1 Industrial Ave.  
Lowell, Mass. 01851  
508-459-5000

### Electronic mail

Electronic mail to be used with the Port Lite entry-level local-area network system has been made available by Waterloo Microsystems, Inc.

Port Lite Mail allows users to transfer mail messages within the LAN, according to the vendor. Features are said to include message filing, the ability to send copies

and registered mail and an on-line directory of users. Available immediately, the price tag is \$295.

Waterloo Microsystems  
Suite 200  
33597 Parkway Ln.  
Norcross, Ga. 30092  
404-441-9252

### Modems

U.S. Robotics, Inc. has extended its Trade-In, Trade-Up program through June 30.

Owners of non-Unix System V.32 high-speed modems from Data Race, Inc., Hayes Microcomputer Products, Inc., Fastcomm Communications Corp., Microcom, Inc. and other companies can get

a Courier HST Dual Standard modem by sending their modems to U.S. Robotics with \$799.

The Dual Standard modem carries a regular list price of \$1,595.  
U. S. Robotics  
8100 N. McCormick Blvd.  
Skokie, Ill. 61176  
312-962-5010

Telecommunications software that adds data compression and error correction to existing modems has been released by Magisoft, Inc.

MTE provides an implementation of Microcom Networking Protocol levels found in higher priced modems. It is especially useful for laptop computers, the vendor said, as it ensures accurate file

transfer in locations that may have poor telephone lines. MTE costs \$79.

Magisoft  
P.O. 386  
Lombard, Ill. 60148  
312-959-2374

A 19.2K bit/sec. synchronous modem has been announced by Case/Datatel, Inc.

The DCM1900 was designed for use on four-wire, point-to-point private lines and includes traffic-coding capabilities, the company said. The unit reportedly measures 3½" by 8½" by 14½"-in. and is priced at \$1,995.

Case/Datatel  
7200 Riverwood Drive  
Columbia, Md. 21046  
301-290-7710

# The Racal-Quanta Fiber Product Guarantee

Our free one-year service contract backs our promise of  
flawless fiber product performance.

Now the finest fiber technology is combined with the worldwide support of Racal-Milgo. The result is Racal-Quanta, a company born of commitment to the most reliable fiberoptic products and services available.

Because we're so confident that you can depend on Racal-Quanta fiber modems and muxes, we're guaranteeing their flawless operation for one year. Should you have a problem, it's no problem. Because at no cost whatever, you can depend on Racal-Milgo's nationwide team of over 400 field service personnel for on-site repair or replacement. All service technicians are prompt, highly trained and well-equipped. See for yourself — take us up on our bonus offer of free installation of your first two units.

Racal-Quanta fiber products bring efficiency and economy to local area communications. Ideal for campus, multi-story, or office environments, our modems and muxes help you take advantage of fiber's special characteristics. Cost-effective, compact, and easy to install, the lines are immune to all types of electrical interference and extremely secure from intrusion.

For additional information, just call us toll-free 1-800-328-2668 (in California 1-714-970-2966).

For problem-free fiberoptic systems, reach for Racal-Quanta, the company that's reaching beyond today's standards.

**Racal-Quanta®**

A Division of Pacific Data Communications, Inc.  
5415 East La Palma Avenue, Anaheim, CA 92807-2022

Offer good for limited time. Valid in the contiguous United States and Hawaii only. Free installation limited to two units per customer.

If your job demands a powerful data analysis tool, the SAS<sup>®</sup> System is your solution. The SAS System gives you ready-to-use procedures for performing every kind of analysis—from simple descriptive statistics to advanced regression, analysis of variance, discriminant analysis, clustering, scoring, and more.

The SAS System reads data in any structure from any kind of file. You can create new variables, modify old ones, combine files, detect errors, and accumulate totals. Once your analysis is complete, you can report your results in lists, tables, charts, or plots.

And as your needs grow, the SAS System grows with you. All the tools you need for color graphics, forecasting, modeling, "what if" analysis, project management, optimization, and quality control are available in the SAS System. You choose the products you need, and enjoy the same easy-to-use language and syntax in each. Plus, you can use the same software on your personal computer.

For details, send us your name and address. Or call a Software Sales Representative today.

# MANAGER'S JOURNAL

## EXECUTIVE TRACK

Anthony Borruso has been elected vice-president and associate director of computer systems at BBDO New York, a New York-based advertising agency.

Borruso joined BBDO in 1983 as a senior analyst and became associate director of computer systems in 1986.

Before joining BBDO, Borruso was a senior programmer analyst at investment banking firm Dillon, Read & Co. for two years and a programmer with Bond Buyer electronic mail service for one year. He holds a bachelor's degree in computer science from New York University and resides in Newport, N.J.

Steven W. Broadbent has been appointed to serve as deputy assistant secretary for information systems for the U.S. Department of the Treasury. Broadbent will serve as the principal advisor to the assistant secretary for management on information systems issues.

Previously, Broadbent worked for AT&T in a variety of sales, sales management and network operations positions from 1982 to 1989. He received a bachelor's degree in nuclear engineering from the University of Virginia in 1976 and then served in the U.S. Navy until 1980.

He subsequently earned his MBA at the School of Business Administration at the University of North Carolina in 1982. In 1987, he earned a master's degree in public policy from George Washington University.

## Speaks softly, carries a big stick

'Quiet persistence' with information systems at Dun & Bradstreet pays off for Field

BY CLINTON WILDER  
OF STAFF

Diversified, decentralized and dependent on information as its lifeblood, The Dun & Bradstreet Corp. poses unique challenges for its top information systems executive. Preceding over IS at the nation's largest information company is a mild-mannered British native who gets things done by what his boss calls "quiet persistence."

Michael Field, Dun & Bradstreet's vice-president of customer information systems, is the type of executive whose low-key style belies his impact on the organization. "Mike Field never seems to be at the center of a storm," says President and Chief Operating Officer Robert Weissman, "but if you look around where something is happening in this company, you'll find Mike Field there."

The power to influence and change is a critical IS success factor at the \$4.4 billion New York-based firm, whose information products range from credit rating services to A. C. Nielsen Co. television viewing data. The biggest challenge, Field says, is getting culturally autonomous divisions — often formerly independent firms acquired by Dun & Bradstreet — to listen at the corporate level.

"Credibility and acceptance are the keys in an organization whose first instinct is not to turn to the corporate office," Field says with a slight laugh. "Usually that's the last thing they want to do. You have to earn credibility and not B.S. them, because only mutual respect will make it work. It's not having the corporate title that does it."

### PROFILE: Michael Field

Position: Vice-president of customer information systems, The Dun & Bradstreet Corp. Mission: To facilitate technology transfer, creative systems approaches and IS cost savings across the company's diversified business units

According to colleagues, Field has earned their respect in four years as top IS executive by knowing which buttons to push — both technical and personal. "Mike helps us understand the complicated business environment at D&B and helps us ensure that our network and computer services accommodate both present and future

needs," says Allan Conner, president of Dunnet, the firm's worldwide packet-switched network for both product delivery and internal use. "He provides me with a great deal of autonomy to react and make decisions. He leads on the broad strategic issues but is hands-off on the majority of the tactical

Continued on page 61

## The fine art of seeking respect for IS

BY ALAN J. RYAN  
OF STAFF

A company that is in the black financially today may not be there tomorrow. And a lack of respect for systems can contribute to such a downfall.

Right now, a scant 5% to 10% of corporate executives across the nation are truly enamored of technology, according to Brenda Lewis, a principal at Transaction Marketing, Inc. in Greenwich, Conn. Lewis said recently that beyond the Fortune 1,000, there are relatively few

companies where the executives use technology at the top.

Lewis said that top management must accept technology as an asset on a par with cash, human resources and noncomputer technologies. But those who do are rare birds today, she said, even among the Fortune 1,000. Of approximately 40 people attending a recent speech by Lewis, just six said they believed their companies treated information technology with importance equal to other major portions of the business. Most agreed that only certain segments of their corporations treated information in this light.

MARVIN KANE

"Just showing expensive systems purchases on the spreadsheet does not mean the information is treated as an asset," one attendee said.

If the company is to thrive, it must commit totally to technology change and the changing needs of customers and must allow for continuous education of all corporate constituencies as a central operating principle, according to Lewis.

"There is a long-standing lack of prestige for the information function," Lewis said.

At one time, she said, information technology was merely a reactive tool used to automate such functions as payroll and scheduling.

The advent of personal computers has brought about the attitude that information is an asset; now, she said, the challenge is to prove that it is an asset worth shouting about.

## Inc. Sales Report

For the first time ever, you can now see the results of your sales efforts in a single report. This report provides a comprehensive overview of your sales performance, including a breakdown of sales by region, product line, and salesperson. It also includes a summary of sales trends and a comparison of actual sales to target sales.

Region	10.0	10.5	10.4
Product Line	10.0	10.4	10.1

# you can have the whole orchestra.

**IBM Interleaf Publisher. The desktop publishing ensemble that does it all.**  
Now at an incredibly reduced price through August 31.

Until now, most desktop publishing software played only one tune. Some performed page layouts. Others executed graphics. Then there were the word processing virtuosos. And the charting soloists.

But now there's IBM Interleaf® Publisher. It performs all these functions and makes them work together in concert. What's more, the critics agree: IBM Interleaf does it all better and faster than the packages that only play solo. Which makes you more productive, whether you work alone or with others, on anything from simple memos to fully orchestrated publications.

Especially when you add the power and speed of any 386+ based IBM PS/2® and the great-looking results you get with an IBM laser printer.

Pop-up menus that let anyone play like a pro. Practice, practice, practice? Not with IBM Interleaf. Its pop-up menus lead you through any task. So you're free to improvise. Create. Even show off a little. Start with a spreadsheet and transform it into a pie chart, then to a bar chart, then to a line graph—instantly.

An overture you can't refuse. Best of all, now until August 31, you can get IBM Interleaf for about the same price you'd expect to pay for one of those one-note packages. Contact your IBM marketing representative or IBM Authorized Dealer today.

To find the dealer nearest you, call 1 800 IBM-7257, ext. 146. And get ready for the applause.

Information Advantage Today

## Field

FROM PAGE 57

issues," Conner adds.

To share his big-picture vision with IS counterparts in the business units, Field hosts an annual meeting for about 75 of Dun & Bradstreet's senior managers and IS directors with the goal of sharing as many ideas as possible. "It's a lot easier to communicate person-to-person than doing it through memos," he says.

Fostering communication is not always enough, however; sometimes, it takes the person at the top to see how one part of the huge Dun & Bradstreet IS organization might learn from another and save a costly development effort. Field believed that the data collection methodology for a rules database being used in

get divisional IS managers to think more creatively.

"There is technology out there today that allows you to take a different approach to designing systems," he says. "I'm trying to encourage all of our units to look at other than the obvious ways of designing them."

"In the long run, that's going to be more important than the millions we're able to save in

equipment costs," he adds.

Field, now based in Winton, Conn., began his computer career with IBM's British operation in London, concentrating on government systems. After four years there, he came to the U.S. to work in IBM's Cambridge, Mass., research lab for two years before joining National CSS in the start-up phase.

At the age of 48, Field still en-

joys tennis and squash but has given up his former favorite sport of rugby. "I kind of miss it," he admits. "but I got a bit too out of shape to keep it up."

However, Field is pleased with the shape of Dun & Bradstreet's corporate IS function, which he firmly believes should leverage its corporatewide perspective to help transfer technologies and methodologies

across business-unit barriers.

"It's business development, in a sense, when you see a particular innovation in one part of the company and say, 'This could really make a difference to our customers somewhere else,'" he says. "We've gotten to the point where [IS] is seen as a helpful area for the units to turn to for different help, facilitation and insight."

**M**IKE HAS been successful in getting others to do the right things."

ROBERT WEISSMAN  
DUN & BRADSTREET

the European credit services business, for example, could also be applied to Nielsen data collection in the U.S.

Field joined Dun & Bradstreet when the firm acquired his time-sharing company, Stamford, Conn.-based National CSS, in 1979. But the key to his climb to the top of IS was a trip back to his native London in 1983, where he headed a major revamp of the hardware and software infrastructure for all of the company's European businesses. That earned him the spurs to move into his present position four years ago.

"Everyone in a corporate staff job here has to recognize that you not only have to have the right answer, but you're only as effective as your ability to get people to agree with that answer," Weissman says. "Mike has been successful in getting others to do the right things."

Weissman discovered Field's persuasion skills early on. "He tried to convince me to look at an Andahli Corp. mainframe when no one else was buying them," he recalls. "I told him no three times, but he kept overcoming my objections, and we bought the first commercial Andahli machine ever sold."

Field is also responsible for making sure that Dun & Bradstreet replenishes its IS equipment stockpile as cheaply as possible—an issue felt in a firm at which 15% of annual corporate spending, or about \$150 million, goes for information technology. But in addition to thinking frugally, Field is making a big push to

# Global competition puts IS in spotlight

BY ALAN J. RYAN  
OF STAFF

**NEW YORK** — Global markets in virtually every industry in the coming decade means that companies must keep even closer tabs on what their competitors are doing — and information technology will play an increasing role in delivering that intelligence.

More and more companies are already putting competitive information on-line where it can be accessed anytime by anyone within the firm, said speakers at The Ruth Sussman Forum, Inc.'s seminar, titled "The Intelligent Corporation," here recently.

"There is a lot of information in file cabinets or in people's heads that isn't being shared," said Anita Goodman, a senior consultant at Strategic Intelligence Systems in New York.

Such on-line competitive intelligence systems, however, can be expensive, need user feedback and should examine not only what competitors are doing but also what they know about what your company is doing.

Such systems should include full-text clips or summaries of ar-

ticles from trade press and general press, news from consultants, market studies, reports and rumors gathered by the sales force and others within the company, said Laura Hunt, manager of information access services at Digital Equipment Corp.

DEC currently has a 5-year-old competitor intelligence system with 10,000 registered users within the firm worldwide, Hunt said. The system is accessed 3,000 times monthly, she said, primarily by the sales force.

When information is collected from such diverse sources as help-wanted advertisements in local newspapers or from the manager of a local supermarket, the information has to be made its way back to a central area before it can be useful, the speakers said.

Some companies have the sales force call in or fax the information and then enter it by hand or scan it into the system, while others have computers in the field where the information can be keyed directly into the system.

In some instances, knowing what the competition is doing can lead to better business deci-

sions within your own firm, said Dennis Earle, vice-president of strategic planning at Bankers Trust in New York.

In banking, Earle said, the importance of a competitor intelligence system is not so much to find out what the competition is doing but rather to know what the competition knows about what you are doing.

Earle said that because any fi-

nancial product can be imitated, a product must be out in the market 12 to 18 months before the competition introduces a similar product if it is going to be profitable.

But no system will be helpful if the users do not use it, Hunt said. DEC promoted its system internally by holding meetings with the sales force and publishing newsletters explaining the

system's benefits, she said. It also encouraged user comments and feedback, so the system could be consistently reworked to meet their changing needs.

The usefulness of competitor intelligence systems must be assessed, Goodman said. If it is truly useful, she said, users should be able to answer yes to some of these questions: Did it help me to develop a new product? Was I able to reposition my products? Was I able to react more quickly to my competitor's eroding market?

## Know your competitors

**W**ithin all corporations lies the means to collect competitive intelligence and disseminate that information to key decision makers, said speakers at the recent "The Intelligent Corporation" seminar in New York.

DEC's Laura Hunt, manager of information access services, presented these criteria for IS executives to implement a successful competitor intelligence system:

- Know your business so you can better understand what the users need from a competitor information system.
- Conduct a study to learn what kinds of information such a system must include.

- Find out who your users will be, how they plan to use the information and the format they expect the information to be in.

- Locate a highly placed technology champion to support the proposed system.

- Designate a project manager to work between the in-house people and outside vendors.

- Allow for systems growth — don't underestimate the number of potential users.

- Be responsive to users' needs by allowing for search techniques and the ability to retrieve integrated information.

- Be sure information is put into the system promptly and removed when no longer useful.
- Include a user-feedback mechanism.

ALAN J. RYAN

## OUTSTANDING 3780 SOLUTIONS

MicroGate Corporation offers two outstanding 2780/3780 BSC (Binary Synchronous Communications) solutions for PCs and PS/2s. Proven in thousands of installations, our MicroGate 3780 emulator stands out with features like background file transfer and a powerful batch command language for automating sessions (attended/unattended). Using MicroGate 3780, standalone PCs can exchange files with remote mainframes, minicomputers and other BSC devices; submit JCL streams to host job entry subsystems; or perform PC to PC file transfer.

For more information on these outstanding 2780/3780 communications solutions, call MicroGate toll-free today at 1-800-444-1962; in Texas and outside the US call 512-345-7791.

**MICROGATE CORPORATION**

MicroGate and SynLink are registered trademarks of MicroGate Corporation. IBM and PS/2 are trademarks of IBM Corporation.

For OEMs and end-users developing custom applications, our MicroGate 3780/API emulator permits programs written in popular PC programming languages to initiate sessions, control sessions, and exchange data at the record level with remote computers in BSC environments.

Both of our 2780/3780 communications solutions are available with SynLink modem cards which combine a multiprotocol adapter and one or more high-speed synchronous modems on plug-in options for PCs and PS/2s.

## Unlocking mainframe resources: spreadsheets

### Why should you be in a crunch just because your end users need numbers yesterday?

Your overworked DP staff can't always download end user spreadsheet data fast enough to meet the demand.

But now there's a way out of the numbers crunch: the Trax Electronic Spread Sheet (ESS<sup>®</sup>). It makes file downloading a thing of the past by giving end users direct, controlled access to spreadsheet data from your IBM mainframe.

ESS is the key. ESS spreadsheets are limited only by mainframe capacity. Windows let end users view data in just about any combination. There's online help, 3-D spreadsheets, integration of PC spreadsheet data, even macro processing.

And anyone who knows the more popular PC spreadsheet packages already knows ESS. For real flexibility, use ESS with EndWord<sup>®</sup>, the Trax word processing program, to integrate numbers and text.

Trax is the key. Join the more than 500 companies using Trax products around the world. Contact: Ben Cox, 10801 National Blvd., Los Angeles, CA 90064. FAX: (213) 470-2487. Telex: 350048. Telephone: (213) 475-TRAX.

ESS and EndWord are registered trademarks of Trax Software, Inc.

Unlocking end user productivity on your IBM mainframe.

# PRODUCT SPOTLIGHT

## MICROCOMPUTER DBMS

### This contest requires a scoring system

BY JOHN LEBER

**A** war of two worlds is going on in the database management system marketplace, and the stakes are nothing less than ownership of corporate information management.

A host of shrinking mainframe products and a battalion of expanding personal computer products are meeting head-to-head in the Intel Corp. 80386 and local-area network server market. Relational mainframe and minicomputer systems are migrating to the PC platform at the same time that originally flat-file micro databases are adding relational and "pseudo-relational" capabilities.

Even at a quick glance, it is easy to see that something historic is happening. Oracle Corp. has announced Oracle QuickServer, aimed at capturing a segment of the Ashton-Tate Corp. dBase market. Software Publishing Corp.'s dBase Professional File, strictly a flat-file product, now supports multiple indexes, data validation and "lookups" from other files, all normally features of relational products. Ashton-Tate's dBase IV provides support for SQL.

DBMS vendors from both the traditional microcomputer and the large-system universes are trying to position themselves as the ideal providers of the true corporate database. The objective of both groups transcends current boundaries. It will not fit users' current conceptions of either mainframe or PC, even though the platform will be a micro. It will not be a mainframe product squeezed into a network server, nor a micro product stretched to fit an 80386. It will be a new beast and a large step toward seamless corporate computing.

The confrontation promises significant benefits for corporate DBMS buyers, as vendors of both types of products adopt some of the best features of the other group. Still, the collision is throwing off so many sparks that

Illustration by [illegible]

it is easy to be blinded and make the wrong selection.

Making a choice today is difficult. The theorists are still arguing. The relational model is in transition. The next incarnation of SQL is waiting in the wings. Benchmarks are deceptive, reviews are subjective, and mistakes are costly.

There are well-defined areas of product strengths, including transaction speed, fourth-generation language (4GL) and development tools, support for SQL and networking capability. However, those particular areas are not clearly related to implementation needs, and unfortunately there is no clear winner across the board.

The only safe path, at this point, is in carefully classifying

and matching functional requirements and product capabilities.

Database management products can be broken into four functional components. By looking closely at these individual components, users can map product attributes against particular requirements. The functional divisions are as follows:

- The back-end engine, which handles disk I/O, reading/writing/finding, query processing/optimization, integrity enforcement and back-end processing.
- The front-end processor, which handles data manipulation and string/arithmetic/statistical operations.
- The DBMS interface, which consists of a data-definition language (DDL) and a data-manipulation language (DML), as well

as the interfaces for both.

• The programmer interface, which embraces the application environment, 4GLs and precompilers and an embedded third-generation language (3GL) interface.

The DBMS engine, or back-end engine, handles all data access, whether a request is from an application written in a 3GL with an embedded request or directly from a menu provided by the DBMS interface.

Front-end processing relates largely to applications. Most database programming languages support data retrieval and storage in memory variables. Once the data is stored, the front end manipulates those variables.

The efficiency with which these manipulations are handled heavily affects both applications and complex report performance.

— a more important consideration if the planned use involves extensive reporting rather than transaction processing.

Front-end processing speed will become progressively more important as database programs become more intelligent. One way to implement intelligence is to use algorithms that are

#### INSIDE

#### Multiple choice

DBMS networking can have many shades of meaning. Page 64.

## Contest

FROM PREVIOUS PAGE

capable of working with uncertainties. These algorithms are not only more demanding—calling for CPU-intensive array processing—but they also operate at the front end. The moral here is not to be unduly awed by back-end performance alone.

In terms of DBMS interfacing, the DDL interface defines the database. DDLs create the database, including tables, indexes and constraints. The DML interface, in the absence of custom applications, manipulates the database. Both of these talk directly to the engine.

The programmer's interface is not limited to the database programming language. It includes any integration offered between a programming language and other components, as well as any programming conveniences provided. An example of the former is precompiler-type checking of program variables against the database dictionary, an example of the latter is project "make" facilities.

### A proper perspective

Although the definitions of these functional components are all quite broad, they provide perspective for product evaluation. Approaching the process this way, it becomes clear that most vendors place heavy emphasis on engine speed not because it is important in most applications but because speed is easier to measure than some of the more crucial variables.

There are simply too many products occupying the new middle ground to discuss all of them separately. It is possible, however, to make some general statements about how micro converts and micro natives perform in classes in these functional areas. For simplicity's sake, the two groups will be discussed separately.

The mainframe and minicomputer programs migrating down are primarily relational products

that use SQL for requests to the engine, both DDL and DML.

DBMS engine-level support for integrity rules are almost universally limited to intra-table integrity. The definition of referential integrity can be simplified to inter-table integrity.

A simple illustration of the potential damage that the lack of referential integrity can cause is the one-to-many relationship typified by a purchase-order "header" table and a purchase-order-item table.

Without referential integrity, the engine will allow deletion of the header record, which usually contains vendor, date, shipping and other information, without

deleting the corresponding item-line records. This leaves the line-item records useless.

The reason for the slow implementation of mainframe and minicomputer DBMSs is quite simply that referential integrity incurs performance costs. Support will probably arrive as a subset of support for the enterprise model, in which business rules can be coded as database constraints and handled at the engine level.

Optimization is built into the back-end engines of these prod-

ucts a menu-driven join operation, which includes generation of a default one-to-many form.

Report capabilities are almost universally excellent among DBMS products from the large-system environment, but report generation is manual. Default reports are very rough, and in order to make a polished report, a "system editor" (i.e., a program file editor) and an understanding of the respective and nontrivial report formatting language are necessary. The same comments

### Selection criteria

Which PC DBMS you choose depends on what components are critical to your objectives

Objective	Critical components
Simple high-volume transactions	Back-end engine
Complex high-volume transactions	Back-end engine and front-end processing
End-user freedom	DBMS interface
Emphasis on complex reports	Front-end processing
Multiple small applications	Programmer interface
Large application	Programmer interface, support for structured language

FIGURE 1: SELECTION CRITERIA

ucts, which use a data dictionary to pick the "best" indices for a specific purpose and to decide whether to do sequential searches or make a temporary index. Not all optimization schemes are equal. For products supporting SQL, as well as query-by-example (QBE), optimization from best case to worst case in query design should be of far more significance than that for best-case.

In terms of DBMS interface, all of the mainframe-heritage products that support SQL inherently support a direct use of SQL as a DDL and a DML. The

apply to form generation.

Import and export are usually handled by utilities run after the memory-resident engine is loaded. Although powerful, these programs are untrifling.

The common heritage of the mainframe products is most readily seen in the programmer interfaces.

These products have a pre-compiler, and the PC versions of the compilers are uniformly slow, awkward and annoying. One of the major problems in that these products still use an external word processor, instead of offering an integrated editor the way most DBMS products that have evolved in the micro world do.

Integration between the pre-compiler and the other DBMS components varies with the product, and this affects both development time and development style. For example, close ties to data and forms dictionaries for type checking are nearly universal among products coming out of the mainframe world, but they are less common among products that started out on micro.

Integration with the DBMS interface also varies. If a vendor's DBMS is sold separately from its 4GL, close attention needs to be paid to integration.

Informa Software, Inc., for example, sells separate packages: a DBMS (engine and DBMS interface) and a 4GL, both of which have the front-end

Continued on next page

## Think networking when DBMS shopping

The most complex technical subjects, networking and databases is conceptually straightforward. Because the goal of a networked database is to allow multiterminal access to the same data—not copies of that data—there are three basic approaches.

The first approach uses a conventional PC-based file server. This is the simplest and most vendor-independent approach. The database program runs entirely on the remote computer—usually referred to as a client—and the server acts as a virtual storage device. In this configuration, the server runs the network server program. Almost all of the micro database management system products that aspire to full corporate status handle networking this way.

The network approach to the DBMS as a local storage device. The DBMS deals with a database on a remote server exactly as it does with a local database; through the operating system. Consistency is the only potential barrier. The drawback to this approach is inherent to the concept—all of the disk I/O involved with a local disk file becomes network traffic. In a sequential search, the entire file is shipped from the server disk to the remote PC.

### Multiterminal approach

A second approach uses a conventional multiterminal, multi-tasking system on the server and allows remote PCs to act as dumb terminals and communicate over the local or wide-area network. Here all processing is done on the server, including processing keyboard responses and coordinating screen displays for the remote computer.

This arrangement, most common among DBMSs written in multiterminal operating systems such as Unix, has all of the benefits—and the liabilities—of a conventional host/dumb terminal setup.

Network traffic is kept low, because only the responses to queries traverse the network and processing is handled by the server. A major drawback is that the processing abilities of the client PCs are wasted.

One relatively new approach is to divide DBMS functionality between the

server and micro, placing the DBMS engine on the server and the front end on the PC. All high-end DBMS products are currently taking this approach.

The benefits of this method of networked operation are considerable. A front end running on a PC can offer all the amenities to which PC users have grown accustomed, including direct video memory addressing for fast screen updates and intelligent keyboard processing for immediate field validations.

Network traffic is reduced to a minimum. Queries and responses have to shuttle only between the front end on the micro and the back end on the server, and translation of queries into appropriate back-end code can be accomplished locally.

### Side effects

However, some significant negatives are associated with this scheme. One is that without additional DBMS software designed for networked operation, a network outage renders data physically unavailable, because the DBMS engine coded to work with and through a network is not the same engine used to work on a stand-alone basis.

A second problem is that the "user" interfacing to the network at the server is no longer the network program but rather the DBMS back end. This means the DBMS back end, the network software and the network hardware must all support one other.

The major DBMS vendors supporting this arrangement regularly update the list of hardware configurations supported, but the limitations are still very real. A change in network hardware or software can be made only if a version of the DBMS is available that supports the new configuration.

Common network services, such as electronic mail and file/printing sharing, are available only if supported by the DBMS/network hardware/network software combination.

None of the three approaches is "best." The first approach is generally least expensive; the second is well-suited to the second, the third, the most powerful. Whichever is best depends on the particular application.

JOHN LEBER

## Contest

CONTINUED FROM PAGE 64

processing capabilities required for reports. Reports developed in the DBMS module cannot be directly incorporated into the 4GL source code, although large portions of the reports are reusable. This kind of split between the DBMS interface and the programmer interface increases programmer labor.

### Seek structured support

Another area in which the differences in programmer interface can be critical is support for structured programming. For a large application, the maintenance advantages to sound software principles cannot be ignored and should be part of the selection criteria.

For example, the Oracle 5.1A programmer interface is based on application development by forms. Applications are developed using SQL\*Forms, which incorporates "triggers," or fields on which either SQL statements or calls to other forms can be made, based on the value of the field. Although this approach offers high development speed, a potential liability is maintenance, because application flow is embedded in forms and not detailed in a source-code file.

Transportability is another issue that should be considered when evaluating a product's programmer interface. Right now, neither programs nor programming skills are easily transferable, even between SQL-based products.

Products with mainframe and mini heritage carry this past with them. Complexities such as support for the relational model and high-power, memory-resident engines have been ported to the PC platform. In these environments, however, they are coming head-to-head with products that evolved there.

The native microcomputer database products are specialists in user-friendly menus, flashy screens and other buzzers and bells. For these products, which were designed for single-user, single-tasking

machines, such feats as direct video-memory addressing and direct keyboard processing are second nature. Concurrency, however, is a new challenge.

The back-end engines in the "upwardly mobile" products are usually incorporated into other components and definitely have a flat-file feel. However, at this stage, they are neither slow nor simple.

FRS:Professional File Version 2.0 is one of the simplest of these products. But it is still fast enough to work quite well with an 8,000-record 3M-byte table; whether that table is in, medium-sized or large depends completely on perspective.

The engine supports nonunique indexed retrieval, unique indexed retrieval and even value lookups from other tables, allowing checks for existence in other tables prior to data insertion.

Heritage is hard to shake, however. The DBase IV engine, for example, is a

### Growing like a weed

Shipments of stand-alone PC DBMSs are projected to more than double in a four-year period.

NUMBER OF UNITS SHIPPED IN U.S.

SOURCE: LATTICE RESEARCH INC.

FOR COUNTRY BUSINESS DATA

strange mixture of power and yesterday's philosophy. Index use is specified by the user, and only one index can be used for retrieval at a time, although up to 47 indexes can be automatically maintained. Indexed retrieval of nonunique multiple keys, however, is not supported.

Front-end processing in the expanding micro DBMS products varies widely in both scope and power. On the high end, DBase IV supports a full set of arithmetic, string and statistical functions, as well as two-dimensional arrays. In flat-file products without a programming language, calculations in reports and global file changes are usually accomplished with a kind of shorthand and proprietary code, often put in fields on a report or form.

The DBMS interface is one area in which these products' heritage is a strength. The interface is almost always menu-driven, usually with on-line context-sensitive help; as usual, power varies inversely with simplicity.

Some products do not have a formal DDL, strictly speaking; defining a form by a field name followed by a colon is sufficient. High-end products use a table-definition form but also support table creation and definition from their 4GL.

### The drive behind QBE

The close integration between the engine and other components makes QBE the most common default query method, and very powerful menu-driven form and report generators are standard features.

In reports, as in front-end processing, the products without a programming language use a type of shorthand for specifying report components. Pushing products such as these to their limits, though, is a bit like programming the old programmable pocket calculators — by the time a "program" reaches 60 keystrokes, it is simpler to use a more advanced tool.

Import/export facilities are advanced and, even in the simplest products,

In the days when isolated PCs ran non-standardized software, these facilities were virtually essential for a successful product. Support for fixed-field and delimited ASCII, DIF files and competitors' files are standard. The products with a programming language frequently allow full-screen report "pasting," with screen-driven creation of labels, page breaks and derived columns — even printer control.

Programmer interfaces are a mixture of elegance, automation and shortcomings. Integrated environments are common, fast compilation (or precompilation) is the norm, but program-type checking is seldom accomplished against the database.

A major consideration with micro products is the abundance of third-party add-on packages, including program templates, documentation generators, program editors with help for each 4GL, and other assistance products. In essence, the PC market is so easy to enter that any failings in a successful product are quickly fulfilled by third parties.

It should be clear by now that differences do still exist between products that grew up on micros and those that moved into the neighborhood fully grown. Micro-developed products are specialists at fast start-up and user-friendly approaches, and they are getting faster and more powerful. Mainframe-heritage products are powerful and becoming friendlier.

Eventually, the differences will disappear, and seamless corporate computing will become a reality. For now, bystanders will have to figure out how to match today's requirements and products without sacrificing tomorrow's options. ■

### Split decision

Nearly half of IBM and compatible mainframe sites surveyed in January gave no indication of plans to use a PC DBMS.

PERCENT OF SITES  
BASED ON APPROXIMATELY 30,000

# Finally, A 4GL That Can Thr

Regardless of the corporate environment, regardless of the application, regardless of the hardware you're working on, there's one 4GL that always delivers fruitful results.

**PROGRESS**, truly adaptable 4GL/RDBMS software that organiza-

tions like The Dannon Company, Sherwin-Williams, and Marriott Corporation rely on to perform miracles every day.

A 4GL that's used in 25 countries in fields as diverse as manufacturing, health care, and bond trad-

ing. That earned the best overall user satisfaction rating two years running (see Datapro Chart).

An impressive track record. But when you take a closer look, it's easy to see why.

**PROGRESS** comes with powerful standard features like automatic crash recovery and ANSI-standard SQL.

\*Compiled from the most recent Datapro Reports on Software. PROGRESS is a registered trademark of Progress Software Corporation. VAX/VMS, MS-DOS, UNIX, and CDB/VSX are trademarks of their respective manufacturers.

# ive In Any Corporate Culture.

What's more, it lets you produce reports, perform queries, and paint screens with an ease no other 4GL can match. And because you write everything in our 4GL, you're guaranteed portability across VAX/VMS, MS-DOS, UNIX, CTOS/BTOS, and networks.

To test-drive a complete evaluation copy of PROGRESS, or to find out about our Demonstration Video, call today.

It's one 4GL that will suit everyone's taste.

*That's*

# Why you should buy computers from a company called Fujitsu.

Because their quality is uncompromising. And it shows in all the ways that make a difference to your business: Performance. Reliability. Service. Value.

That's not just our opinion. It's the opinion of companies and individuals who have placed us among the four leading computer makers in the world, with annual computer sales of over \$10 billion.

They know we make some of the fastest and most powerful scientific and business computers on earth. And that all Fujitsu computers have a reputation for quality and high reliability.

In America, Fujitsu's Series 2000™ PICK®-based family of products offers business professionals cost-effective solutions to their business needs. Ranging in capacity from the 18-user System 2100™ to the 160-user System 2600™, the Series 2000 family of business computers lets you choose the proper system for your current needs, with a clear growth path for future expansion.

Computers are our No. 1 business. But they're not our only business. You may already know us for our fiber optic communication systems. Or PBX systems. Or facsimiles. Or cellular telephones. Or even for advanced semiconductors and electronic devices.

They're among the thousands of Fujitsu products that make us a \$16 billion high technology leader, with almost 100,000 employees and projects in over 100 countries worldwide.

So if you're considering a computer system, we'll show you some very good reasons to consider Fujitsu. Write Fujitsu Microsystems of America, Inc., 3025 Orchard Parkway, San Jose, CA 95134. Or call 1-800-874-9927.

Series 2000, System 2100 and System 2600 are trademarks of Fujitsu Microsystems of America, Inc. PICK is a registered trademark of PICK Systems, Inc.

# Downsizing? Use caution

BY ANDREW TOPPER

There are several powerful arguments for taking advantage of the miniaturized versions of mainframe and minicomputer database management systems for development purposes, but a moment or two of quiet reflection is warranted.

Most mainframe vendors now offer personal computer-based versions of their own DBMSs and fourth-generation languages, and some third-party vendors have also built close approximations of the most popular large-system tools. Using these products for micro-based creation of large-system databases can help save money, time and CPU resources. Potential buyers of these products should be aware, however, that translations may not be exact and that using PC versions of large-system DBMSs may mean dealing with limitations and incompatibilities.

The large-system connections do not, for example, give these products any special immunity when it comes to constraints on memory and storage. Like most native micro DBMSs, these tools are generally limited to 640K bytes with standard DOS 3.0, and their disk file sizes typically fall below 32M bytes.

While some vendors support extended or expanded memory, most cannot overcome the DOS file allocation limits. Those that do get over the DOS hurdle have to rewrite the low-level assembler routines, at the expense of compatibility with normal DOS programs.

If the intended use is PC-based development of mainframe or minicomputer databases, compatibility with the large-system version is a critical issue. Identifying incompatibilities can help users decide how much additional effort will be required if they choose to download their development to PC.

Some points to consider are differences in maximum record length between PC and large-system products, limits on multiple logical connections and the degree of difficulty involved with EBCDIC to ASCII conversion. All micro-based versions of large-system DBMSs—whether direct descendants or third-party tools—suffer from some or all of these problems.

Two products representative of the current state of compatibility are Information Builders, Inc.'s PC/Focus and Micro Focus's Micro Focus Cobol/2 IMS option.

PC/Focus was one of the original products to appear on the market offering development compatibility with a mainframe DBMS. The current version is compatible with most Focus applications but may balk if faced with one that is extremely large. Additionally, PC/Focus currently limits record length to 4K bytes, while the mainframe version allows records up to 12K bytes in length.

The current version of the Micro Focus Cobol/2 IMS option does not support multiple logical connections between databases. Other current IMS incompatibilities deal more with the behavior of an application than with its ability to be generated and run on a PC.

For example, when a sort is used in a PC Cobol program or an index on a PC

IMS file, the ASCII values do not correspond exactly with the EBCDIC values. This variation can cause a difference in the way in which data is displayed or reported.

Solutions to many of these problems are either in the works or planned for future versions, but in the meantime, it is wise to ask yourself what level of compatibility between the mainframe product and the PC-based tool is necessary before you invest. \*

## Mainframe/mini DBMS products available on PCs

Mainframe product vendor	PC product vendor

## How to match the best front end with the best back end.

You've invested in the best hardware, operating system and database products. You have a staff of programmers ready to go. But to build great looking applications with the sophisticated features today's users demand, you need a powerful front end development tool—JAM™.

Create colorful screens and menu windows easily.

JAM, the most advanced user interface management system on the market, does it all—from prototyping to implementation. And, because it works with any database, or file manager, you get the best front end and the best back end. JAM is hardware independent, so it isn't limited to one computer, database or operating system. In fact, JAM runs on everything from PC's to super-minis, works under 7 operating systems and provides access to a host of database products. Using JAM you can create a consistent user interface across multiple systems and hardware platforms.

JAM makes it easier than ever to design and revise complex applications. Using features like context-sensitive help, procedural command language (JPL), shifting and scrolling fields, extensive data validations, on-line testing, and a variety of visual attributes, you'll be amazed how quickly your applications spring to life.

JAM is fast, so well as flexible. Development time is reduced significantly thanks to JAM's powerful screen drawing utilities and comprehensive library of subroutines. You can easily create and link together screens, windows, and menus to develop an application shell. Then simply attach the processing routines, and your application is complete.

# JAM

JYACC Application Manager. *The Composer for Sophisticated Applications.*

Plus, if your back end is an SQL-compatible relational database like Oracle®, SQL/DS®, Inform® or Britton Lee™, you'll really appreciate JAM/DB. JAM's optional database interface. With JAM/DB, you can develop entire applications using only industry-standard SQL statements and JAM's authoring tools.

So if you're programming in a SQL, like C or FORTRAN, follow the lead of the many Fortune 1000 companies who have already discovered JAM.

JAM runs on JYACC. It gives you the best at both ends.

For more information about JAM and our demo diskette, JYACC, Inc., 116 John Street, New York, NY 10038, 212-267-7722 FAX No. 212-608-6753

# A DBMS that fits your needs

BY PAULA STONE

In advising "Suit the action to the word, the word to the action," Shakespeare was, I suspect, not referring to choosing between a flat-file microcomput-

er database management system and a fully relational product.

The general wisdom behind his words, however, can certainly be applied to the DBMS realm,

in which both flat-file programs and sophisticated PC versions of mainframe relational products have their place. The rub, of course, is in matching your product

selection to your needs.

Do you trade a relational DBMS' long-term use for the ease of training and setup offered by a flat-file DBMS? When you pit the more authoritative, albeit slower, queries of full relational searches against the rapidity of flat-file searches, do you favor power or speed?

Laura Dopersinski, PC training administrator at Minnespo-

lis-based Best Buy Co., the fourth largest consumer electronics chain in the U.S., asked these questions when she joined the company last October and found its business managers struggling to stay on top of burgeoning sales from the chain's 41 retail stores.

What the managers needed was a fast, straightforward, easy-to-use tool for simple trend analysis and sales tracking. It was obviously inappropriate to provide terminal access to the systems running inventory, marketing and financial applications on the company's IBM 3081 mainframe. It would be too expensive and slow, and the abundance of information that would

**D**O YOU trade a relational DBMS' long-term use for the ease of training and setup offered by a flat-file DBMS?

be heaped on them would go largely unused.

The Ashton-Tate Corp. Dbase IV DBMS used by the programming staff was too complex for the managers. They needed to focus on their area of interest: they needed information fast; and they needed flexibility in printing final reports. Also, the tool had to be compatible with the company's 300 IBM and Compaq Corp. 80286-based personal computers.

For Dopersinski, the clear choice was a flat-file database. It was easy to use and provided speedy data searches. Selling for typically less than \$200, it met the managers' needs in a cost-effective manner.

Best Buy purchased Software Publishing Corp.'s Professional File 2.0, which the marketing department had successfully used to develop a database to track and analyze its employee training and certification program. In addition to acting as a traditional flat-file DBMS, Professional File also pulls duty as a low-end relational DBMS, providing employees in training with information on their training and travel time.

The short learning curve of the flat file enabled users at Best Buy to quickly set up the database, making it easier to meet corporate sales goals. For example, using Professional File's application development tools, Best Buy built a sales-tracking database. The vice-president of marketing uses a vendor number from his sales and marketing database to locate a vendor in a vendor file. This allows him to learn more about a vendor

Stone is a free-lance writer based in Plano, Texas.

**COMPUTER  
ASSOCIATES**

without accessing all the data in the sales-tracking database.

Professional File's relational capabilities allow Best Buy's vice-president to track which products sell and at what rate, Doperalski adds.

Other companies have thrown their buying weight behind the more powerful fully relational DBMSs. In 1988, a Northern Telecom, Inc. manufacturing plant in North Carolina's Research Triangle Park selected Empress Software, Inc.'s Empress relational database.

Best Buy's  
Doperalski

"A number of databases had been announced at the time, but Empress was the only fully relational database available to run directly in the Unix environment," according to Jerry McKennie, Northern Telecom's manager of information systems.

Empress was purchased to complement Northern Telecom's existing custom PC-based database system, which was running under QNX, Quantum Software Systems Ltd.'s real-time, multitasking operating system. Back in 1983, Northern Telecom, needing a database that could operate in a real-time, multitasking environment, wrote an engineering/manufacturing management program in C using Faircom's C Tree software development tool.

At the time, the database held a list of more than 10,000 components, including all the data operators needed for manufacturing assembly and quality. Hard-coded

in C, it provided a number of predefined reports and relationships, and queries were executed very quickly, McKennie says. However, the size of the database had nearly doubled since its creation.

The inability of the nonrelational system to immediately query new data or data relationships ad hoc was getting in the way of Northern Telecom's engineers and engineering managers, who needed an easy way to change a data segment's relationship to the whole, he explains.

Northern Telecom's solution was to port applications requiring fully relational capabilities to Empress running on 20 Intel Corp. 80386-based PCs running AT&T Unix V.3, Release 2. These applications, which initially reside on some of the more than 300 IBM Personal Com-

puter ATs running under QNX on seven local-area networks, are linked via a homegrown terminal emulation link to the 386 machines.

For the majority of its business, Northern Telecom remains loyal to QNX. "Where we have not needed to migrate from C Tree under QNX, we haven't," McKennie says. But he applauds "the use of 386-based PCs for bringing true relational capabilities for data management."

From Unix, users can access standard reports available under QNX or use SQL to perform advanced queries and produce reports. An operator can now query the system to learn how many hours will be affected and their names if one component is changed. Under Unix, Empress allows users who know a standard language

such as SQL to generate a new type of report, McKennie points out.

"This [report writing ability] allows a wider group of people to access the information more readily without having to be C programmers," he explains.

"Where we're at now is exciting," he adds. "We can now buy standard off-the-shelf word processing and spreadsheet programs that run under Unix to further increase productivity."

According to McKennie, the use of PCs in the company's manufacturing operations has grown from one full-time and one part-time user to hundreds in five years. The entire unit has realized millions of dollars in savings. McKennie sees databases on PCs as having played a significant role in this savings. □

## If Your SQL Queries Seem To Take Forever...

## You Need MDBS IV.

### ASK THE VENDOR

I've been a user of Lotus' Symphony for a number of years and am impressed with its database capabilities. However, my application is very large and is sometimes limited by the amount of random-access memory available. How does Lotus plan to address memory management in future versions of Symphony?

Daniel Ficker  
President

Micro Realities  
Macon, Ga.

LOTUS DEVELOPMENT CORP.: Symphony 3.0 requires 384K bytes to operate and 512K bytes of RAM if the split-checker and other large add-ins are involved. As you know, all MS-DOS-based products are limited to working within the 640K-byte environment unless certain memory management techniques are implemented. Currently, Symphony is designed to support the Lotus/Intel/Microsoft Expanded Memory Specification technology, which allows users to access more than 640K bytes of RAM.

While it is our policy not to comment on unannounced products, we are committed to Symphony and will continue to support existing and potential customers' needs for better memory management.

### Performance.

MDBS IV provides the superior performance that your on-line, mission critical applications require. Even on a microcomputer LAN with dozens of concurrent users, MDBS IV can access multiple gigabyte databases and offer sub-second SQL query response times.

### Integrity.

MDBS IV also provides features such as abortable transactions and two phase commits, which protect the integrity of your database. In addition, the very nature of MDBS IV's treatment of data relationships guarantees referential integrity.

### Client/Server Architecture.

Today many DBMS vendors are claiming data base server technology is new. We installed our first data base server in 1984. With 150,000 installations worldwide, we have perfected what others have only begun to explore.

### Portable.

MDBS IV is available on a wide range of micros, LANS, minis, and work stations. It is also being ported to the mainframe environment.

mdbs and MDBS IV are Registered Trademarks of mdbs, Inc.

MDBS IV is one component of the mdbs Technology Platform. This platform is woven of products and services designed to work together to provide a powerful, synergistic approach to applications development. Components of the mdbs Technology Platform include expert systems, relational DBMS, object oriented tools, consulting, support and training.

Find out more about MDBS IV and our FREE Technology Symposium. Send or FAX us the coupon below or call (800) 344-5832. In Indiana call (317) 463-2581 and in Canada call (416) 733-3299.

The companies included in this chart responded to a recent telephone survey conducted by *Computerworld*. When a vendor is unable to provide specific information about its product, the abbreviation NP (not provided) is used. When a question does not apply to a vendor's product, the abbreviation NA (not applicable) is used. Further product information is available from the vendors.

Digital announces  
a new line of  
products which  
brings the proven  
superiority of  
distributed  
computing to a  
totally new level.

## Introducing the world's most powerful desktop computers.

Until now, desktop computer power has been measured by what you can do *at* your desk.

According to experts, the true measure of power will be what you can do *from* your desk. And that takes complete hardware and software integration.

Today, there's one company with a family of desktop computing systems whose power, by both these measures, is second to none: Digital.

### Powerful new hardware.

For PC users, there's the DECstation™ 210, 316 and 320 systems—the first industry-standard PCs sold and supported by Digital.

For UNIX® users, there's the DEC-

station 3100 workstation. Its state-of-the-art RISC™ technology makes it the fastest desktop workstation in the world today.

For those who want it all, there's the VAXstation™ 3100 workstation. It's a VAX™ workstation that runs the VMS™ operating system and industry-standard UNIX and can run MS-DOS® applications as well. Its price/performance is triple the world's best-selling workstation—our own VAXstation 2000.

To complete the picture, there's the VAXstation 3520 and 3540 systems. They give you all the power you need in 2-D and 3-D graphics workstations.

VT™ 320

digital

#### Powerful new software.

Our new DECwindows™ desktop software, part of Digital's Network Applications Support,™ offers something no other windowing system can. The ability to access applications across operating systems.

With DECwindows software, you can display VMS, UNIX and MS-DOS applications at the same time.

Imagine the possibilities. If your desktop computer runs the VMS operating system, you can display VMS applications, plus applications from any UNIX or MS-DOS computer. The same is true if you're running a UNIX system. Whether you're a user or an applications developer, with DECwindows software there's one, easy-to-use interface that's the same across operating systems. You can display text, graphics and imaging all at the same time.

#### Behind it all, standards.

Our ability today to offer such total, systemwide integration comes

from years of experience working for a single goal. To make it easy for people to work together. And that demands an adherence to standards.

It's why we've taken a leading role in standards bodies, championing the adoption of open standards. It's why we're the leaders in networking, with more multivendor networks than anyone else. And it's why we back up our products with worldwide, world-renowned service.

Now, with our family of desktop computing systems that lets information be shared from desk to desk anywhere in the world, we'd like to show you how much more productive everyone in your company can be.

VAXstation 1000  
Compatible with  
multiple vendors  
software as well as  
other VMS  
operating systems

DECstation 1000  
Integrated on-site design  
or LA engineering facilities  
Operating systems  
UNIX

VAXstation 1000  
Access to CAD or scientific R/D facilities  
Operating systems VMS

Now anyone  
can have  
a window office.

With DECwindows software on a VAXstation 3100 workstation, getting the whole picture is easier than ever.

digital

Our new DECwindows desktop software, part of Digital's Network Applications Support, opens up a whole new way to look at windows. Because it lets you do the one thing no other windowing system can—share applications across operating systems.

Here's how it works.

If your desktop computer runs the VMS operating system, you can display VMS applications, plus applications from any UNIX or MS-DOS

computer. The same is true if you're running a UNIX system. You even have access to applications running on large computers like VAX, IBM® and Cray systems.

The beauty of it is, it isn't complicated. DECwindows software makes it very simple.

Whether you're a user or an applications developer, with DECwindows software there's one, easy-to-use interface that's the same across oper-

ating systems. You can display text, graphics and imaging all at the same time. And with our new DECwrite™ and DECdemon™ software, you can link your document's information with its source. Whenever it changes there, your document can be instantly revised.

DECwindows desktop software. It's your window for integrating all the computing resources of the organization. All right from your desk.

One easy-to-use interface lets you display applications across operating systems. You can display financial projections running on your MS-DOS computer.

Using the same interface, you can display graphics running on a VMS computer to update your report.

Just as easily, you can display a file from a UNIX computer. It's all yours to manipulate the way you want.

Now anyone  
with a PC can  
join the company.

Programs developed on  
a Windows 1160 work-  
station or any department  
can be shared with programs  
from other departments.

The HUAN Series 2000  
network lets PC and work-  
station users share information  
across the network—locally  
or company-wide.

digital

If you just want to tie your PCs together in a local area network, any PC LAN vendor will do.

But, if you want to tie your PCs together and make them an integral part of your company's network, any PC LAN vendor won't do. Because it's not what they do. It is, however, something Digital does better than anyone else.

With our PCLAN/Server™ 2000 system, the latest implementation of Digital's Network Applications Sup-

port, you can easily tie together PCs from major manufacturers like Apple, COMPAQ, IBM, Olivetti and Zenith. Besides letting PC users share information with each other, the PCLAN/Server 2000 system lets them share information with any computer on the network - no matter what size it is, no matter where it's located. It's the kind of total integration that only Digital can deliver.

Because the PCLAN/Server 2000 system is powered by VAX technology, not PC technology, users can avoid the usual LAN bottlenecks that slow down their access to information. Because it's VAX technology, it also means you can grow in any direction you choose. And finally, Digital offers full service and support for any system on the network.

The PCLAN/Server 2000 system. All the resources of your company's network are now available on a local area network.

*Figures from a spreadsheet analysis on a Macintosh 512K in the field can be used to update reports in the regional office.*

*Results from a manufacturing application on an IBM PC/XT on the factory floor can be incorporated in manufacturing at headquarters.*

## The rewards of working together.

From the beginning, our success, as well as the success of the leading companies we work with throughout the world, has been based on a single vision. To design totally integrated computer systems that work together so people can work together.

With the introduction of our new desktop computing systems and DECwindows software, we extend the vision even further. Now there's one company that provides total hardware integration to join your company at every level. One company that provides total software integration to make software a common resource shared by all. One company that provides total service and support to make sure it all works the way you want it to work.

That one company is Digital.

digital

We invite you to discover the rewards of working together. And to discover what a difference it can make.

To learn more, write to Digital Equipment Corporation, Desktop Products (Z), MKOI/WB3, Continental Boulevard, Merrimack, NH 03054-9987.

Away to work together like never before.

Digital  
has  
it  
now

## Managing the Macintosh

*How to orchestrate users' networking, peripherals and applications needs*

BY ASHLEY GRAYSON

**M**anaging micro environments based on Apple Computer, Inc.'s Macintosh is a growing specialty within the information systems community. Superficially similar to managing IBM and compatible personal computers as well as other computer systems, the job also carries an aura of uncertainty. Are Mac users fundamentally the same as PC users? Or does using a Macintosh, like taking Dr. Jekyll's tonic, transform the mild-mannered office worker into a counterculture Mac activist?

Actually, managing the Mac environment requires only a slightly different perspective on the manager's part and a strong ability to deal with the unique Mac elements. Among the issues governing the Mac community are its rather diverse body of users and the rapidity of change. It is not surprising that the questions of where you are now and where you want to go with your Macintosh environment need to be asked before planning how to get there.

The manager with the task of introducing Macintoshes into an organization should first identify the roles the Macs are to ful-

fill. Originally, computers were placed in an organization for an individual to use to complete a certain task. Today, the objective of becoming computerized has shifted in many companies from the well-defined delivery of specific applications to vague goals of enhancing personal productivity without a clear idea of how that will be measured.

Despite the difficulty in quantifying productivity, experienced managers report that Macs do not fundamentally change people, although they often amplify both individual traits and group dynamics. Thus, the newly appointed Mac manager might be faced with any one of a range of management expectations:

- Make the organization work better by bringing in Macs, which might be perceived by

some users — and even upper management — as somehow superior to PCs.

- Communicate throughout the company one department's successes achieved with Macs.

- Build a particular Mac-based capability within the company such as presentations and publishing.

- Merge Macs into an existing PC or mini/mainframe structure.
- Get a grip on the uncontrolled growth of Macs being acquired within various departments organizationwide.

Fortunately, most of the technical issues that must be faced in acquiring Macs and peripherals and making decisions about networks are independent of whatever situation the manager faces and can be handled with the same set of managerial and organizational skills. The users' needs will merely establish the order in which the ques-

tions of systems, storage devices, networks and so on are addressed.

Universal issues that the Mac manager will have to consider include the following:

- Which Macs to buy and who gets what kind of machine.
- Which add-ons and peripherals to buy.

- How to best benefit from the built-in network that is part of every Macintosh.

- What applications to standardize on and how much nonstandard software should be encouraged or tolerated.

An intriguing quality of today's Mac market is the rapidity with which decision criteria will shift. An entire analysis can be invalidated by a single product announcement.

### Pick a Mac, any Mac

Despite the profusion of new models, the decision about which Macintosh to acquire hinges on a few key points:

- Except for applications requiring color monitors, anything the Mac can do, it can do quite well on the original one-bit black-and-white monitor.

- All of the new Macs — the Mac SE/30, Mac IICX and Mac IIX — run at the same speed. It is no longer necessary to provide a Mac II just because the user needs a faster machine.

- The single expansion slot on the SE/30 is not used on any other Mac and is not compatible with the older SE's slot. Apple's proprietary standard NuBus slots on the Mac II family are all mutually compatible.

- Only the SE/30, Mac IICX and Mac IIX include the Motorola, Inc. 68030 processor, which

NICK WIGGINS

Grayson is the founder of ADG, a San Pedro, Calif.-based organization that develops sales tools and programs for high-technology companies. ADG operates its own network of Macintoshes and PCs that contains one of almost every thing.

- Diverse users, changing market critical
- Do Macs really change people?
- It's not so different from managing PCs

will be needed in order to benefit from the features in System 7.0, the Mac operating system upgrade due January 1990. Older products — the Mac Plus, Mac SE and Mac II — lack the necessary memory management hardware. System 7.0 will require at least 2M bytes of memory.

The Mac manager's dilemma of acquiring Macs without the 68030 chip or going with the new line is analogous to that faced by its PC counterpart in

will the short-term cost benefits outweigh the longer term expansion limitations?

Another aspect of hardware choice is accelerators — expansion cards that can significantly speed up a Mac Plus or SE. While they are a good way to speed up existing systems, they may cost as much as a new SE/30. Further, such accelerators currently lack the 68030 chip, and managers should carefully consider whether or not to adopt them until they offer a memory management solution.

**T**HE QUESTION for the Mac manager and the corporation is, will the short-term cost benefits of not going with the 68030 chip outweigh the longer term expansion limitations?

entering the Intel Corp. 80286 vs. 80386 face-off. The fact is that the 286-based PC and the Motorola 68000- and 68020-based Macs will be left behind by future software requiring the newer systems. (There is the possibility of making a board switch, but that is nearly as expensive as buying a new machine.) The question for the Mac manager and the corporation is,

The next decision facing the Mac manager is from whom to buy. PCs may have paved the way for the mixed-vendor shop, but as the only non-IBM PC or compatible PC acceptable to business, the Macintosh relies heavily on third-party hardware and software to deliver value. Often, pure Apple configurations lag behind mixed-vendor configurations in both capability and price/performance measures. In any case, a less expensive alternative may be the better solution.

Functionality, too, often comes late from Apple. For example, Macintoshes have long been promoted for their ability

to do high-level page layout and design. However, until January of this year, when Apple introduced single- and double-page black-and-white monitors, the largest monitor Apple made was the 14-in. color monitor for the Mac II. Buyers who wanted larger screens had to look to such vendors as Supramac Technology Co. in Mountain View, Calif., and Sigma Designs, Inc. in Fremont, Calif., for high-resolution monitors and video cards.

#### Bying down

Also in January, Apple offered its first hard disk larger than 80M bytes — a 160M-byte hard disk. Previously, disks holding more memory than 80M bytes had to come from Rodime, Inc. in Boca Raton, Fla., Jasmine Technologies, Inc. in San Francisco, CMS Enhancements, Inc. in Tustin, Calif., Supramac or any of a dozen other vendors.

Today, third-party vendors are the only source for 300M- and 600M-byte disks. Large disks for working and archiving are an absolute necessity for any department doing desktop publishing or desktop presentations; stored images and page layout files can take up 500K bytes to 1M byte each, sometimes even more. Many users will likely need such large disks.

While important to the marketplace, Apple's broadening of its product line is not without a few trade-offs. The company has a tendency to develop products — such as electronic mail, word processing and database — pos-

party price advantage is continually appealing.

Therefore, the Mac manager must expect to seek out performance products from a variety of vendors and through sales channels that include mail order, retailers and systems integrators.

Many of the third-party vendors exist only within the Mac community and range from the established Jasmine, the largest of the mail-order houses, to such start-ups as Microset Technology, Inc., a small Irvine, Calif., company with a wide hard-disk line. Experienced computer managers may recognize and feel more comfortable with long-time Digital Equipment Corp. VAX add-on vendors such as Clearpoint, Inc. in Hopkinton, Mass., which now offers Macintosh memory cards, and CMS Enhancements, which offers a variety of Macintosh-compatible disks.

#### Tying it all together

Networking is an almost-free extra on Macintoshes because of the AppleTalk controller embedded in every Mac. Cables to route the network are available from Apple, Sun Microsystems, Inc.'s Tops Co. division in Alameda, Calif., and Farallon Computing, Inc. in Berkeley, Calif., among others. This simple

# Look where our information systems are today.

It might surprise you to learn that our own aerospace companies are among our biggest customers. But it's true. And it makes a lot of sense. We wouldn't have been able to develop such sophisticated products unless we developed

network will allow a work group to share an Apple Laserwriter. Adding E-mail requires a system such as Microsoft Corp.'s Mail or Tops' Inbox. To implement file sharing requires making some careful choices among programs such as Apple's AppleShare or Tops' network product and then assessing the need for more exotic networking such as Ethernet. Apple is rumored to be considering supporting Token-Ring-based networks but only for Mac II family models.

The choice of a network can significantly affect an organization's work flow. File transfer allows people to exchange information when needed. Networks carry the information's entire file structure, not just individual files, to the whole user community. The manager deciding on networking architecture will need to have an understanding of how Mac users actually work, but the criteria for decision making are easy to enumerate:

- Basic Appletalk allows a work group to share a Laserwriter and add E-mail at low cost.
- Although AppleShare dedicates an entire Mac to the job of file server and requires operations management, it has several advantages: Uniform, organized backup is possible when all files are on the same server; a system

of user/group/world file access privileges similar to those found under Unix and VAX/VMS are enforced; and a single print queue is maintainable on the server.

- Tops may be a better networking choice if the sharing requirements change dynamically and need to be under the users' control. Because Tops allows users to manage their own machine's presence on the network, it will always do what the users want without a lot of the Mac manager's attention. Whether Tops is more uncontrollable or more adaptable depends strictly on one's point of view, but there are two solid advantages to Tops. First, it can be introduced on one computer at a time because it is only a software module. Second, Tops also works with PCs if a Tops Flashcard is installed in the computer. Low-cost modules allow PCs to print on the network's Postscript printer and exchange files with the Macs.

#### Mac standardization

It would be ironic if the machines that offer users a unique environment for creativity became so strangled in standards that they blocked the self-expression possible with the Mac. Nevertheless, some standards must be maintained, or the very attri-

butes that make the Mac an appropriate choice as a medium for cooperative work will spread confusion at electronic speeds.

Thus, the Mac manager should view himself as an orchestra conductor, allowing each player complete discretion in how he plays while keeping everyone on key and in time with one another.

- Which word processor, spreadsheet and mail system should be on every system? In today's Mac environment, there are several choices for virtually every application. Such programs need to be selected not only on the basis of their features but on how well they integrate with other packages. The choices between Microsoft's Word and Ashton-Tate Corp.'s Full Write or Microsoft's Excel and Informix Corp.'s Wings and Adobe Systems, Inc.'s Pagemaker or Quark Xpress are not always clear. Word 4.0 can even compete with Pagemaker for most office layout applications. Further, Wings may represent an appropriate alternative development tool to Hypercard for numerically intensive user-developed applications.
- What standard programs should always be available under the Apple menu (the

source of the ever-present desk accessories)? Apple has indicated that desk accessories will function differently under System 7.0 and will disappear in System 8.0.

- How will backup be handled? Even with a central file server, users can isolate or hide — and thus possibly lose — po-

data, or controls, the appearance of a document from the text and images in the document. Style templates can be shared, and a document can be easily viewed in different styles. Every dollar invested in developing good templates can return threefold in reduced user training, smoother operation and the greater comprehension possible with uniform document appearance.

The Macintosh environment is good for studying what happens when standards, set up to be followed, may not actually be what people use in practice. Indeed, even when focusing on the hardware and software of the Macintosh, the way people choose to work overrides many technical issues such as networking, and the unique qualities of the Mac changes what people can work with.

This year and next comprise a period of major announcements, not just of point products but of direction-shifting standards. Both Apple and third-party vendors wait customers to buy now but do not always correctly identify what trends will drive future products. Often, they do not know. The buyer's challenge is to build a decision-making process that will select solid alternatives at each point. ■

tentially valuable data by storing only to their machines and not to the file server as well.

- Once established, how should standards be enforced? One understated mechanism for spreading organizational standards is the use of style templates in Microsoft Word. Word on both the PC and the Mac can separate in a template the information that for-

- 1 With EDI<sup>®</sup>Net<sup>®</sup> our Electronic Data Interchange service, our MD-80 suppliers get our purchase orders in short order.
- 2 PERMAC2, our Plant Engineering Resource Management and Control System, keeps the equipment that builds our MD-80, MD-11, C-77 and now the F-15E, in topflight condition.
- 3 Production of our Harpoon missile never misses a beat, thanks to ProGr<sup>®</sup>WORKBENCH<sup>®</sup>, our computer-aided software engineering tool.
- 4 Efficiency soars, but costs don't, because we use our spatial database product, GDS, to manage our corporate aerospace facilities.

# Central Fidelity Is Banking On AT&T Computers.

*Left to Right  
Donn Dodrill  
AT&T Area Technical Manager*

*Jay Livingston  
Corporate Executive Officer  
Central Fidelity Bank  
Richmond, Virginia*

Richmond, Virginia  
February 2, 1989

Central Fidelity Bank is among the nation's top 100 commercial banks with \$4.8 billion in assets. Looking to extend its fourteen-year record earnings streak, the bank commissioned its data processing division to deliver a vital strategic initiative, improve productivity, enhance sales opportunities, and provide faster customer service in the bank's nearly two hundred branch offices. Jay Livingston met recently with Dean Dodell of AT&T to review their work together.

**Jay:** Service is what bank customers expect. Faster service improves customer satisfaction and leads to more profitable relationships. When you speed up service, everyone is more productive, and we can spend more time with customers selling the bank's financial products.

**Dean:** Service and selling both depend on information. Our challenge was to provide the branches with rapid access to customer information and present that information to branch personnel in the most meaningful way. This could only be accomplished with a distributed, networked computing approach.

**Jay:** That's right. Our first priority was service and sales support in our branches, which meant fast, accurate retrieval and dispersal of information was crucial. AT&T's banking architecture provided that.

**Dean:** Early on, you talked about cost-effectiveness, return on investment, and a strategy for future growth and functionality. Remember that?

**Jay:** With an emphasis on profitability. We had major investments in existing systems and a lot of branches. AT&T's open systems approach didn't require trade-offs or expensive host additions, which is one of the reasons

you got the business. AT&T's creative alternatives surprised us.

**Dean:** The ease of networking AT&T WGS computers was fundamental to our proposal. We delivered maximum functionality, flexibility, and reliability to every workstation in each branch.

**Jay:** And StarLAN was a terrific way to connect and share branch resources. You made the most of our assets, including the intangible ones.

**Dean:** Like your customer databases—we found ways to further develop relationships with existing customers. The applications development tools we built saved time for your developers. New products and services can now be added quickly to both platform and teller software, so service and sales can continually improve.

**Jay:** Every bank employee associated with this system has become more productive. In my twenty-three years of banking, I've never seen a vendor provide such high-quality service and support. Central Fidelity Bank and AT&T are well positioned for the future.

# OPEN SOFTWARE ARCHITECTURE

ONLY AUTOMATE/MVS\* HAS IT.

Operators deal with multiple software products. From multiple vendors. Shouldn't your automated operations solution be like your "perfect" operator? AutoMate/MVS is.

Many software vendors stress integration with other products they sell. Their automated console products interface with their performance monitors. Or their job schedulers. Or their databases. Sure, AutoMate/MVS also interfaces with other LEGENT products such as Multi-Image Manager, SMR, TPX, TSO/MON, DASDMON, MICS and NetSpy™.

But isn't there more? You bet. With its new Open Software Architecture, AutoMate/MVS grabs and reads to information from multiple sources. Such as CA-7™. And Candle's Oregamon™. And IBM products such as NetView™, RMF and IMS. In fact, virtually any VTAM application.

LEGENT customers worldwide have discovered that AutoMate/MVS is powerful, easy to use, and complies with SAA standards, and is NetView compatible. And

they have the support of a company that has been developing leading operations productivity software for nearly 20 years. And rated #1 in technical support by close to 100% of our customers.

AutoMate/MVS is the tool for all the right reasons, now, and as your automated operations environment grows. It's a winning decision. Make it today. Call 800 323-2600 and ask for your LEGENT account representative (in Pennsylvania, call 412 323-2600).

## INDUSTRY INSIGHT

Nell Margolis

### Snipping the purse strings

Venture capitalists have lately observed something profoundly unsettling about the purges that cut the nation's technology enclaves from Route 128 to Silicon Valley: There seem to be cars in every one of them. Where are today's seedling entrepreneurs?

They're not out in the garage where they ought to be, one dismayed venture capitalist told me. "We've got plenty of money, and we're interested in funding genuine start-up-level deals—but we're having a hard time finding good ones to fund," he lamented.

Just last month, the state of California conferred historical landmark status on the garage in which Messrs. Hewlett and Packard kick-started the company and the Silicon Valley legend. Maybe "historical" is the operative word. "There's certainly no shortage of brilliant people and great ideas," the venture capitalist said. "Places like Digital and Hewlett-Packard are check-full of them. Why aren't we seeing people coming out of DEC and HP to start their own companies?"

## Sale reels in \$450M for CDC

BY ELLIS BOOKER  
OF STAFF

**MINNEAPOLIS**—The pruning of Control Data Corp. continued last week as the onetime computer industry giant sold its most profitable unit, disk-drive maker Imprimis Technology, Inc., to Seagate Technology, Inc. for \$450 million in cash and securities.

The sale is the latest in a series of divestitures by CDC, which in April announced a \$490 million restructuring charge and the folding of its money-losing supercomputer subsidiary.

The Imprimis deal, announced June 12 and still subject to regulatory approval, called for Scotts Valley, Calif.-based Se-

agate to pay \$250 million in cash and transfer \$10.7 million worth of stock to CDC.

In addition, CDC will receive a \$50 million promissory note from the drive maker. Under the agreement, Seagate will also supply data storage devices for CDC's Cyber line and Government Systems Division.

#### Pricey market

In announcing the Imprimis sale, CDC Chairman and Chief Executive Officer Robert M. Price said the OEM market for disk drives was doing well. The sale, Price said in a prepared statement, requires "considerable investment in new technologies to remain competitive."

CDC and Seagate, which have been talking for the past 1½ years, hope to complete the deal in August or September, according to a CDC spokesman.

Price said CDC will now focus on the services and systems integration side of its business while enjoying growth in the disk-drive business through its Seagate shares. After the stock transfer, CDC will hold about 18% of Seagate common stock.

Imprimis, formerly the Data Storage Products division, was incorporated late last year by

CDC. The unit posted revenue of \$1.15 billion in 1988, accounting for nearly one-third of CDC's \$3.6 billion in sales.

Some analysts, expressing surprise that CDC would sell its most profitable division, see the action as part of a larger move away from the commercial market.

"We see CDC slowly walking away from the commercial market and concentrating on the government and scientific [computing] business," said Curt Boussard, director of systems and peripheral technology at International Data Corp. in Framingham, Mass.

## Spring cleaning

#### What is gone:

- March: Twenty-two Control Data Institutes in West Germany and France sold.
- April: Approximately 3,100 jobs cut; ETA Systems, Inc. supercomputer subsidiary folded; Cyber mainframe business streamlined.
- May: Action Data Services sold; Control Data Institutes and Institute for Advanced Technology sold.
- June: Imprimis Technology, Inc. sold.

#### What remains:

- Cyber mainframe and workstation sales and support; Energy Management; and Government Systems.
- Data processing services.
- Audience research firm The Arbitron Co.
- Microgenius automated trading room information systems.
- Ticketron services to state lotteries and off-track betting.
- Credit Union Services.
- Quorum System automated services for the legal market.
- Business Information Services.
- EFT Data Services.

BY HELEN PIRKE

**MADISON, Wis.**—Joiner Associates, Inc. brings a new twist to the never-ending debate over form and function.

The company functions as a privately held business, as a consultancy based on the statistical quality principles of W. Edwards Deming and as a network job entry (NJE) provider for IBM-Digital Equipment Corp. connectivity. Its form is based on the family's surname of Joiner. It is an ironic acronym for the point at which its flagship networking product and its consultancy coincide.

"Our clients are interested in transforming the way they are managing their companies," said

Laurel Joiner, executive vice-president, about the company she founded with her husband, Brian, in 1983. "Software helps that to take place. It enhances productivity."

As consultants, the Joiners have attracted a select cadre of long-term clients from the electronics, heavy manufacturing, service and process industries that are interested in continuous improvement in their companies. The Joiners' approach closely parallels the work of Deming, the wartime AT&T engineer who taught the Japanese about low-cost, high-quality, high-volume manufacturing. Now age 85, Deming is back at work consulting in the U.S.

One of the underlying princi-

## Better days at Information Science

BY ROBERT MORAN  
OF STAFF

**MONTVALE, N.J.**—When Bruce Coleman, chief executive officer and president of Information Science, Inc., joined the human resources management software company in November 1988, it was flourishing in a sea of unprofitability.

Today, Information Science shows \$104,800 in profits for its third quarter ended Jan. 31, based on quarterly revenue of \$3.5 million—a far cry from the \$564,300 net loss on \$2.8 million revenue that the company posted for the comparable period last year.

Further, Coleman speculates that fourth-quarter and year-end figures, when they emerge later

this month, will be written in black. Information Science's current goal, according to Coleman, is to gain market presence with its human resources software tools. Its products include Classic, a modular system for non-database management systems environments; Database for Adabas and DBS environments and its premier product, Saavi, which provides integrated applications with SQL/DBS relational retrieval and natural-language support tools.

#### Choppy waters

The person charged with spearheading the anticipated turnaround is conditioned to steerily organizations through choppy waters. Coleman is the former

chief executive officer and president of IBM-based software maker Boole and Babbage, Inc. He led that organization to 26% annual sales increases and pushed it beyond its 1985 losses of approximately \$6 million to after-tax profits of \$3.1 million in 1988.

There are several similar scenarios on his resume, each with at least one commonality: Coleman's penchant for taking chances.

Indeed, Information Science has crossed the line into profitability and is generating surely needed cash. "The object of any turnaround is to fix the eternal problem: When you're losing money, you tend to have no cash," Coleman said.

With less backpedaling, infor-

mation of equity from loans and independent investment and a continuing revenue stream, Coleman led the company in the early fourth-quarter acquisition of implementation Support Associates, Inc. (ISA), a human re-

sources consultancy and provider of customized software in Orangeburg, N.Y.

An acquisition so soon may raise a few eyebrows, but Coleman said that ISA was a statu-

## NICKELS &amp; DIMES

Cermestek Microelectronics, Inc. reported a loss of \$131,000 for the third quarter ended March 31, compared with net income of \$19,000 for the third quarter last year. Revenue for the quarter was \$802,000, compared with \$1.8 million reported last year.

Emulex Corp. reported revenue for the third quarter ended April 2 of \$37.9 million, compared with \$31.8 million last year. Profits were \$3.7 million, compared with \$2.4 million a year ago.

Cipher Data Products, Inc. announced revenue for the third quarter that ended March 31 of \$51.2 million, compared with \$44.7 million reported a year earlier. Profits were \$9.9 million, compared with \$5.4 million the previous year.

LSI Logic Corp. reported revenue for the first quarter ended April 2 of \$134 million, compared with \$73.1 million last year. Profits were \$9 million, compared with \$4.7 million the previous year.

Pyramid Technology Corp. announced revenue for the second quarter ended March 31 of \$24.6 million, compared with \$18.9 million the previous year. Profits were \$2.1 million, compared with \$2 million reported for the comparable period a year ago.

Maxtor Corp. reported revenue for the fourth quarter ended March 28 of \$97.7 million, compared with \$85.7 million a year ago. Profits were \$1.4 million, compared with \$6.1 million for the like quarter a year ago.

Omegat Corp. announced the results for its first quarter ended April 2. The company reported revenue of \$24.8 million and net income of \$1.6 million. For the corresponding quarter of 1988, revenue was \$30.1 million and net income was \$3 million.

Cognos, Inc. announced revenue for the year ended Feb. 28 of \$107.9 million, an increase of 30% over the previous year's revenue of \$83 million. Net income more than doubled to reach \$4.3 million, compared with \$3.1 million for the previous year. Results for the fourth quarter show revenue of \$36.1 million, an increase of 34% over last year's fourth-quarter revenue of \$27 million. Net income was \$3.3 million, up by approximately 50% from the \$2.2 million reported in the like quarter last year.

On-Line Software International, Inc. announced income before extraordinary gain of \$834,000 for the third quarter ended Feb. 28, compared with \$1.9 million for the like quarter a year ago. During the current quarter, the company also realized an extraordinary gain of \$675,000 from the recognition of convertible debt. Revenue for the quarter was \$21.1 million, compared with \$23.4 million a year ago.

Computer Horizons Corp. reported revenue for the first quarter ended March 31 of \$19.7 million, compared with \$19 million for the previous year. Profits were \$401,000, compared with \$675,000 in the comparable period a year ago.

## Info Science

CONTINUED FROM PAGE 81

ural fit with Information Science. ISA, already an authorized Information Science agent prior to the acquisition, brings strength in project and practitioner skills that will balance what has been missing at Information Science, Coleman stated.

## In the pink

Although the acquisition is on the books for the fourth quarter, Coleman appeared confident that the company will show fourth-quarter profits.

Further, he is betting that the two organizations will be able to provide systems integration support and service for

human resources and management systems.

"The time for a surge forward is when you are profitable," Coleman said.

Coleman considers the company to be in phase two of its turnaround, which started in late 1987 when an investor group led by Vanguard Atlantic Ltd., a merchant bank in which Information Science Chairman Ernest E. Keet is a principal, injected \$9 million into the troubled company.

In November 1988, Keet brought Coleman on board as president to continue the turnaround effort. Coleman was elected CEO this past April;

Keet will remain as chairman.

With the first phase completed, Coleman will continue to attend to products and services and concentrate on selling to approximately 500 active clients as well as new prospects, he said.

"Coleman has demonstrated a talent for giving companies focus and turning them around," said J. Neil Weintraub, an analyst at Hambrecht & Quist, Inc. "In Sci (Information Science) is going to present him with a significant challenge — but it has a chance to become the leading independent provider of human resources software."

Information Science's Coleman

# TO HALF THE PROGRAMMERS IN THE WORLD, C LOOKS LIKE THIS:

## εντελώς ασυμπίεστος

Half the world's programmers write in COBOL. Most of the world's code is in COBOL. For powerful, flexible, and above all maintainable business systems on the mainframe, COBOL has proved the best choice.

Realia brings those strengths to the personal computer. Realia COBOL generates highly optimized machine code, superbly compact and unmatched for speed. Our debugger revolutionizes the development cycle. RealCICS and RealDL/I provide true mainframe compatibility. We run on the plain 512Kb PC, and take full advantage of the high-end machines.

Some of our users are making the PC a development workstation, so a mainframe application can be downloaded without change, enhanced, and uploaded for production. These users' investment in existing COBOL systems and staff is enormous; they need the productivity gains Realia provides.

But what about the small software houses, with five or six hot programmers and total PC commitment? They're choosing Realia COBOL in great numbers, for blindingly fast executables, thorough operating-system exploitation, and add-ons like Realia ScreenIO, which cuts development time by up to 70%.

Concentrate on your new application, not a new language. Call Realia for a free 30-day evaluation.

# REALIA

## Joiner

CONTINUED FROM PAGE 81

plan to improve quality is understanding variation and data, and how you analyze that data," Laurel Joiner said. "Software will help you get that done."

Besides serving their long-term clients, the Joiners and their staff conduct public seminars, publish journals and have recently come out with "The Team Handbook," a manual that shows how to pursue improvement projects in teams using Deming's statistical quality method.

As a software development company, Joiner Associates deals with management issues of a different kind — systems management between DEC VAXs and IBM mainframes.

The flagship product is called Jnet. It provides transparent file, batch, print, electronic-mail and real-time message transfers at the NJE level between DEC and IBM machines.

"NJE and Jnet were a happy coincidence," Laurel Joiner said. Referring to Stephen Arnold, who co-wrote Jnet, she

noted, "Steve was aware of how important an interactive product would be to helping people do their jobs more efficiently."

Arnold, the company's research and development vice-president, co-wrote Jnet as a VM-to-VMS file transfer product.

To some extent, it was an extension of work he had done with the Joiners several years before on Minibit, a statistical software package. Minibit was co-written with Brian Joiner for the VAX/VMS environment in 1979 while Brian was teaching at Pennsylvania State University in State College, Pa.

The program, Laurel Joiner said, was designed to make statistics understandable to students, not merely to crunch numbers. "It was about shortcuts instead of calculations," she said. The Joiners subsequently sold

their one-third interest in Minibit to start their new company.

Currently, they have 46 employees, evenly divided between the consulting and the software development groups. Each group accounts for about half the company's annual revenue, which should

be about \$6 million this year, according to David Miller, a business aide to the mayor of Madison prior to becoming Joiner's president.

"We're trying to help people move from the hierarchical, three-tier level of MIS to a client-server architecture," Miller said regarding the software organization's long-term goal.

"We want to help customers bring all those local-area networks into those corporate backbones," he added.

On the Unix front, the company hopes to drive jobs across Transmission Control Protocol/Internet Protocol, while later this summer it expects to release a new product for DEC-to-Application Systems/400 connectivity called the BSC/400 link driver.

### Standard techniques

"It's the thrust of the industry, especially between IBM and DEC, to get to some level of standards advice," said Myron Kirstetter, who advises midrange clients for Gartner Group, Inc., a market-research concern in Stamford, Conn.

"Some companies do it by speed. Some by interfaces. Joiner does it by expanding the NJE technique," Kirstetter continued.

From a price-setting point of view, Jnet is inexpensive compared with Fast-

Laurel Joiner strict for interaction products

path from Intel Corp. or Interlink Computer Corporation, Inc.'s Channel connection, he said.

"Jnet is riding in a low-cost, reasonably functional ivory," Kirstetter added.

By May there were more than 1,200 Jnet systems in 31 countries. According to Miller, between 30% and 40% of higher education and business nodes in the U.S., Europe and Canada have Jnet.

The lowest price for installing Jnet on a Vaxstation is \$1,700, with the typical software purchase intended for a Microvax connection to an IBM 370 for \$8,000.

### Freed up

According to George Reid, IS director for Sanford C. Bernstein & Co., Inc., a money management organization in New York, "The real beneficiary in the systems manager who doesn't have to lose his hair out. [Jnet] frees up the systems manager to take care of installing new systems [and] new software releases."

Reid, who installed Jnet software a week before Memorial Day, said the decision had been made last winter to move toward an IBM Systems Network Architecture gateway to VAX in order to run IBM sessions on VAX workstations.

"Our user population uses both, and we wanted to not have dual pieces of equipment," he added.

## Margolis

CONTINUED FROM PAGE 81

Because first, they'd have to leave DEC or HP, said another venture capitalist who has spent time pondering the same question. This is because an overwhelming preponderance of even those who are still twentysomething are more comfortable with risk if it ends with a c.

"A lot of today's entrepreneurs have forgotten what's involved in entrepreneurship," he said. "I want to start my own company, they tell us, but I want to make \$100,000 a year."

Ironically, he said, the success of the last generation of entrepreneurs is serving to stop the start-ups of this generation. "There are so many success stories," he said. "Everyone knows somebody who started a technology company that really took off. It all seems so close, so easy. You think, that's how it happens: You start a company and become a millionaire. You forget how they got there."

The fellow who's telling me this is himself a several-time computer industry entrepreneur; in his latest venture, two years out of the starting gate, is his first one on the giving rather than the be-seeing side of the venture capital desk. "When my partner and I started our first company," he recalled, "we went without salaries for months." If you wonder what it would be like to have your sanity questioned, he suggested, try proposing a paycheck moratorium to someone who has had the run of the laboratories and the pick of the perks at a large computer company.

"Just recently, our company almost did a start-up deal with a guy from one of the big companies," he said. "He had a

beautiful product concept, a great business plan, and he was really turned on by the idea of doing it himself. We were excited too; it had never written all over it." On the eve of the paper-signing, the would-be entrepreneur withdrew from the deal. "He told me he was really sorry," the venture capitalist said, "but he just couldn't leave his corporate dental plan."

Venturers who won't let go of their security blankets, said the venture capitalist, make for venture capitalists who won't let go of their purse strings. This vicious circle goes a long way toward explaining why, when you lift the garage door these days, you're more likely to find Mercedes and BMWs than Sieves and Staves.

On the other hand, security — like entrepreneurialism — ain't what it used to be. As the industry matures and consolidates, each month brings a new crop of layoffs and downsizings and redundancy curbs and job eliminations and other measures that, whatever other problems they might import, at least from the affected folds from dental plan separation anxiety. Back in the 1970s, when the aerospace industry went through the same stage with the same result, some of the new unemployed were shattered. Others made a quick and agile leap to another corporate post. But none, as attested to find that the security for which they had given up entrepreneurial dreams had been illusory all along, started companies.

Where salaries are freezing, entrepreneurial ambitions could be coming to a boil. Got a garage near, say, Maynard, Mass.? Don't peddle the door just yet.

Margolis is *Computerworld's* senior editor, industry.

# Is Your Field Service Group The Profit Center It Could Be?

It's amazing how much money some companies are making these days from field service.

Or is it?

It just takes better tools like FieldWatch™ field service management software.

The FieldWatch system streamlines, supports and controls critical functions throughout your service group.

The result: a leaner organization that delivers better service, better customer satisfaction, better asset management, and better profits all at once.

Our free information kit will show you how. Call extension 569, 617-272-4100. In the USA: 800-267-1300. In Canada: 800-537-9246.

FieldWatch™ The Better Way.

# Why Businessland Keeps Networking Itself.

As one of the world's leaders in desktop connectivity, it's hardly surprising that Businessland® is itself one of the most heavily networked organizations in the world.

In fact, Businessland operates its own business through over 130 connected LANs, integrating components from dozens of different hardware and software manufacturers. Connecting micros

to minis and mainframes located throughout the United States, Canada and England.

So, we don't just know how to network. We also know how connectivity impacts a business environment. How electronic mail not only improves communication and reduces "meeting" times, but how it opens up entirely new and more productive ways to work.

And how sharing resources can

reduce expenses and support staff.

The proof? At Businessland, the sales per employee has more than doubled in five years.

So if you'd like to learn more about networking from someone who really understands it, just give us a call at 1-800-328-8383 for the Businessland Center nearest you.

**BUSINESSLAND**

## Effect Of Networking Businessland (Sales Per Employee)

## CDC sale

CONTINUED FROM PAGE 81

Bismont said he had always viewed Imprimis as an important revenue producer for CDC, adding, "The bottom line is, they apparently needed the cash."

"In effect, [CDC is] going from a very dispersed computer conglomerate to a focused information services company," said Michael Gorman, an analyst at Nikko Securities Co. The various draconian measures taken by CDC since the first of the year — which, at latest count, include the sale of its European-based computer maintenance organizations to a West German company, announced within days of the Imprimis deal — have probably suc-

ceeded in making the company financially viable, he added.

Other observers agreed that the sale made strategic sense. "I think one explanation is [Imprimis] was the least integral to their ongoing business strategy," said Gary Smaby, managing director of Minneapolis-based Needham & Co. "The disk-drive business is nearly a commodity business, and in that sense, Imprimis has always been viewed as a spinout candidate." Indeed, Smaby and others said that at the creation of Imprimis late last year, there was speculation that the unit would be put on the block.

The immediate financial impact of the deal, according to analysts, will be to help CDC retire its \$150 million in senior debt, leaving the firm with around \$100 million

in cash. "So, next year, if the negotiations don't stall, they'll be cash-flow positive and be able to stay out of the bank," Smaby said. For Seagate, which posted revenue of \$1.26 billion in its most recently reported fiscal year and is already the world's leading independent drive supplier, the Imprimis acquisition is a watershed event, said IDC analyst Jay Bretmann. Seagate and Imprimis, he noted, have synergistic product lines and minimal manufacturing overlap.

However, when asked about staff reductions or moves at Imprimis, which employs about 8,500 people worldwide, as a result of the sale, an Imprimis spokeswoman would say only that no changes or reductions are planned. Seagate employs approximately 28,000 people worldwide.

## Now there's an expert system that thinks big...and small.

### Introducing the PC version of KBMS.

KBMS first AICorp made large-scale expert systems practical, with the KBMS knowledge base management system for IBM mainframe environments.

Now we've made expert systems even more practical, with KBMS/PC for OS/2 and MS-DOS environments. It gives you an easy entry into high-powered expert systems—and an easy growth path to the full mainframe power of KBMS.

#### Smart enough but powerful.

On the one hand, KBMS/PC is a powerful and robust stand-alone expert system development tool. It uses all four AI methodologies: goal-directed reasoning (backward chaining), data-driven reasoning (forward chaining), hypothetical reasoning, and object-oriented programming. And it utilizes natural language for English rules and explanations, giving you unmatched ease of use and rapid development. But that's only the beginning.

#### 300% compatible growth path to your IBM mainframe.

KBMS/PC is fully compatible with KBMS for your IBM mainframe, so you can build on your investment in programming

skills and applications when you're ready to grow. You can use KBMS/PC to prototype, develop and test applications on your PC, easily and economically—then port them up to your mainframe without modifications. It's a clear growth path almost without limitations.

And KBMS on your mainframe is fully compatible with your IBM environment. It's written in C and integrates seamlessly with MVS/ESA, MVS and VM operating systems; with CICS, TSO, IMS/DC and CICS teleprocessing systems; and with DB2, IMS, VSAM and other database management systems.

#### Ask about seminars near you.

Before you make a decision about expert systems, find out more about KBMS, the fully compatible solution to expert system development.

To schedule a demonstration, or to learn the locations and dates of the seminars nearest you, please call (617) 890-8400. Or write AICorp, 100 Fifth Avenue, Waltham, MA 02254-9136.

## AICORP

Bringing AI Software to Business

KBMS  
The only practical knowledge base management system  
for your IBM mainframe and PC environments.

KBMS is a registered trademark of AICorp, Inc.

## IN BRIEF

### Ups and downs

Figures released last week by the American Electronics Association (AEA) showed a 4.4% decrease in the U.S. from electronics trade deficit and a 0.4% increase in the U.S./world electronics trade deficit in the first quarter of 1990, compared with the first quarter of last year. AEA President Richard Iverson greeted the news with caution.

"We would like to see at least three consecutive quarters of improved trade balance, both with Japan and with the rest of the world, before we feel even marginally comfortable," he said.

### Senior redeemer

Storage Technology Corp. last week petitioned the Securities and Exchange Commission for approval of a public offering of \$100 million in senior subordinated notes. The notes, to be due in 1996, are intended to help redeem Storage Tek's 13.5% senior debt. Storage Tek's debt is also due in 1996. Shannon Brothers, Inc. will underwrite the offering.

### Starling catch

Starling Software, Inc. is poised to acquire Ottawa-based software developer Health Information, Inc. The privately held Canadian firm's flagship offering is the Zin fourth-generation language and application development tool kit, which is aimed at relational database users across a wide variety of platforms.

### Chips spring anew

Last June, Intel-based manufacturer Analog Corp. will become the new owner of Sunnyvale, Inc.'s Oculis (Springfield) Solid State Electronics division, a maker of the ETA CPU chips. Terms of the deal were not disclosed. The acquisition, touted by Analog President George Portogru as "an important effort in establishing a significant U.S.-based semiconductor manufacturing facility," was unanimously voted before the Semiconductor Industry Association confirmed a decline in last month's high-to-low rates.

### And the winners are...

Five U.S. companies were recognized with their high-technology innovation awards and development projects cited by Department of Defense. Recipients of the 1990 U.S. Innovation Awards include: Raytheon Corp., Providence, Inc., Novartis, Inc. and Pharmacia Technology, Inc.

# Whose ad is this, anyway?

That's a very good question.

Because, instead of being an ad for the 20 very different companies you see here, it's actually an ad for the one industry standard that makes them very much alike.

The PostScript® language from Adobe Systems.

Choose a printer or typesetter from one of these companies and you can make the choice for PostScript. Because each of these manufacturers has licensed Adobe's page description language.

Why did they do it?

For one thing, PostScript delivers the ultimate in output quality and

capability. Whether you're printing simple text for everyday correspondence or complex graphics for electronic publishing, PostScript makes it easy.

PostScript also gives you absolute freedom to select the best hardware and more than 4,000 software programs for your needs and budget.

That's called compatibility and Adobe PostScript guarantees it.

So, even though different PostScript printers and typesetters offer different resolutions, paper handling options and output speeds, you can be sure they all work together.

Because they all speak the same language. The language of PostScript. Now, aren't you glad you asked?

This ad is presented by Adobe Systems Incorporated, which encourages you to look for the PostScript symbol on computers, printers and other products that support PostScript software from Adobe Systems. It's your guarantee of quality and compatibility. Adobe PostScript and the PostScript logo are registered trademarks of Adobe Systems Incorporated in the U.S.A. The logos of the original equipment manufacturers supporting PostScript are the trademarks or registered trademarks of their respective companies. © 1985 Adobe Systems Incorporated. # COMPUTER CAREERS

## Plenty of room for QA experts

Global competition is driving expanding interest in quality assurance

BY SHERYL KAY  
SPECIAL TO CW

As IS groups strive to produce the biggest bang for their buck, it has become increasingly crucial to enhance systems quality. One result is a growing emphasis on the role of the quality assurance professional.

QA is one of the fastest growing functions within IS, according to William Perry, executive director of the Quality Assurance Institute in Orlando, Fla. The number of quality assurance positions at Fortune 500 companies and comparably sized government agencies has increased at a rate of 25% per year for the past five years, according to research by the institute. The group works with its 1,000 member organizations, both software vendors and users, to enhance information systems quality through conferences and other activities.

One reason for the growing demand for QA is the increasing pressures of global competition, according to Bill Bowl, senior QA engineer at GTE Data Services Corp. in Tampa, Fla.

"We can see the Japanese improving in the software industry, and the Republic of Singapore

will also be a giant in a few years," Bowl says. "This is because they are very serious about quality."

As global competition heats up, more U.S. companies will place greater emphasis on quality, and the QA specialist will be depended on even more.

Typically, the QA professional's responsibilities involve reporting on the status of current projects, devising proposals for general quality improvement activities, such as new measurements, and following up by implementing the initiatives.

Information systems QA is still a young field, and there is not a firm consensus among IS groups regarding exactly what it constitutes or how it should be pursued. Some firms find they need only the resources of one QA manager, while others depend on a team of QA analysts.

### Quality subalternship

Whether executed by an individual or a group, the main objective of QA is to "aid quality," says Paul Tex, who is both database and QA manager at the state of Indiana's Information Services Division in Indianapolis. It is therefore important for all QA candidates to demonstrate traits such as leadership, vision, the ability to communicate, enthusiasm and innovation.

A systems professional also should have a strong statistics background, with knowledge of tools such as cause-and-effect graphs and Pareto Charts, a technique adopted from manufacturing QA in which problems are ranked from most severe to least severe.

However, QA professionals tend to say these skills are secondary to personal attributes. Perry notes that information systems QA tends to be less rel-

**W**E CAN SEE the Japanese improving in the software industry, and the Republic of Singapore will also be a giant in a few years. This is because they are very serious about quality."

BILL BOWL  
GTE DATA SERVICES

ant on statistics than manufacturing QA. "Our surveys show that less than 5% of large companies know their [software] defect rate," he says.

Narcis Sill, vice-president of IS at Centel Credit Corp., a leasing company in Atlanta, adds that a good systems background is important. "QA is there to review the work of technical people, and people in technical positions generally respect someone

who has done their work and who was recognized as having done it well," Sill said.

Rebecca Staton-Reinstein, director of corporate quality at New York Life Insurance Co., says she finds QA activities personally rewarding. "I can look back and say, 'This was a problem area, this is the process change that we initiated, and these are the dollars saved,'" she says. "It makes you feel good because you know you have really contributed."

However, Bowl says that improvements do not always come easily. "You have to have management commitment and the right environment. The IS pro-

due in part to the differing perceptions of QA among organizations, Perry says.

A QA career offers significant growth potential, according to Sill. Her abilities as vice-president in IS reflect the benefits of her seven years in QA at First Atlanta Bank. With their expertise in how things should be done correctly in IS, QA specialists can be attractive candidates for promotions to positions such as business analyst, corporate QA specialist and IS director, she said.

In addition to software vendors, companies most likely to have robust QA departments include defense contractors, because of their contractual responsibilities to the Department of Defense, and companies that have suffered from major systems disasters.

For preparation, Staton-Reinstein advises interested systems professionals to read works by such QA leaders as W. Edwards Deming, Tom Peters, Phil Crosby and J. M. Juran. She also recommends *Hitchhiking the DP QA Function* by Perry and *Quality Data Processing — The Profit Potential* by Leon Ellsworth and Claude Burrill.

Staton-Reinstein also points to courses offered by the Institute of Electrical and Electronics Engineers and the Quality Assurance Institute.

Key is a Tampa, Fla.-based business consultant and free-lance writer specializing in emerging technology and human resources.

## The Professional vs. The Enthusiast

The Professional does a job and does it well. But the Enthusiast is someone whose level of ambition turns contributions into achievements. In short, the Enthusiast is someone who's ideal for Executive Life. Why? We're California's #1 life insurance company, we're dedicated, we reward performance, and we're looking for Programmers who can excel in our IBM environment.

A knowledge of life insurance products and a background in COBOL, Assembler, CICS (Command/Macro),

and troubleshooting with IBM equipment using OS/VSX, XA, TSO/ISPF is required. Exceptional candidates from other financial fields will be considered.

You may be one of the Enthusiasts we're looking for... ready to be acknowledged for much more than just your presence. If so, consider a career with Executive Life.

The right candidates will receive an excellent salary and comprehensive benefits, including medical/dental/life insurance, a health and fitness center, employee restaurant, child resource

program, flexible spending account, tuition reimbursement, and much more. To apply, contact John McFarland at 1-800-323-8617 or 213-312-2311, or send your resume to: Executive Life, Human Resources, Dept. #0619CW, 1444 West Olympic Boulevard, Los Angeles, CA 90064. We are an equal opportunity employer. Principals only, please.

# Are You Underpaid?

## FREE Salary Survey Includes the Latest Salary Statistics in Your Area

have occurred and some are expected.

What impact do the more significant market shifts have on careers and income? Are you keeping up with changes?

The 1989 Local Metropolitan Computer Salary Survey is a great way to learn more about what's going on in computing. The latest local data on salaries in 54 metropolitan areas are reviewed.

You'll learn about market trends and salary data for more than 60 position titles and responsibility levels. Included are titles ranging from staff programming and system analysis levels to top computer management.

So, if you're concerned about what you can expect to earn—as well as what market shifts will impact your future—you owe it to your career to get a copy. It's free... compliments of Source Edp, the nation's largest recruiting firm devoted exclusively to the computer profession.

## PROFESSOR AND HEAD OF SCHOOL INFORMATION SYSTEMS

Applications are invited for the position of Head of School of Information Systems, one of the five schools in the Division of Business and Administration. The University is seeking an outstanding academic leader, with a proven record of scholarship and research in the field.

The School of Information Systems undertakes teaching and research associated with the analysis, design, implementation and evaluation of information systems in organizations. The programme offered encompasses Bachelor of Business through to a PhD in Information Systems. The School is involved in the Division's MBA programme and services other Schools in the Division, namely Accounting, Business Law, Economics and Finance and Management.

The School has a growing international reputation in a number of areas of Information Systems, namely Information Systems Planning and Strategy Formulation, System Development Methodologies, Decision Support Systems and End-user Computing and is looking to expand its activity in these areas. Research fields such as Software Engineering, Systems and Software Quality Assurance, System Design Approaches, Automated Support Tools, Executive Information Systems, Commercial Exploitation of Expert Systems.

The appointee will be responsible to the Deputy Vice-Chancellor of Business and Administration for the academic management of the School and will be expected to maintain professional and academic links with local, national and international communities, lead the development of and contribute to scholarship; act as research of both staff and students and monitor the continuing relevance of the School's academic programmes. Successful applicants will have the support of one or more senior academics in the internal administration of the School.

Candidates should have high academic qualifications and have demonstrated a capacity to manage research effectively. The appointee will be expected to take an active role in the range of interests represented within the School. Relevant professional experience at a senior level is also expected.

**Salary:** \$50,000 p.a.  
 Between the third and fourth quartile, annual salary is \$50,000. The appointee will be expected to have the support of one or more senior academics in the internal administration of the School.

**Applications:** Details include the name, address and telephone number of three referees should be submitted no later than 15th July 1989 to the Personnel Manager, Curtin University, GPO Box 191, Perth, Western Australia 6001. Closing date for applications is 15th August 1989. Shortlisted candidates will be invited for an interview. For further information contact the Personnel Manager, Curtin University, GPO Box 191, Perth, Western Australia 6001. Tel: 09/422 2222. Fax: 09/422 2222.

Curtin is an Equal Opportunity Employer

## THE UNIVERSITY OF TEXAS MEDICAL BRANCH AT GALVESTON

### BUILD YOUR FUTURE WITH UTMB

THE UNIVERSITY OF TEXAS MEDICAL BRANCH, located on Galveston Island, located 50 miles south of Houston, is pioneering on new technology programs.

Online applications are supported by the use of CDC/IBM microcomputing system. More than 1,000 user devices are active on the growing network. The IBM 3082 production system and the IBM DB/2 relational database system are operational 24 hours a day. Software products used include CDC/COMOL, PCIS, DLI, MVS, 350, PCIS, and VSAM. Several new opportunities are currently available.

#### MANAGER OF INFORMATION SYSTEMS

Coordinate resources to support the institutional information Center. Qualifications required include five years experience as a manager in data processing with a minimum of five years experience managing an information Center.

#### DATA ADMINISTRATOR

Establish a Data Administration function, to include the implementation of a data model to support an information Systems Plan and the selection and implementation of a data dictionary. Plan to agree with data processing resources to include four years of experience in application technical support and database data administration is required.

#### APPLICATION DEVELOPMENT AND IMPLEMENTATION PROJECT MANAGER

Manage resources that develop or install product applications in business, academic, and hospital settings. Four to six years experience in large applications development and implementation, with two years experience in a supervisory role is required.

#### METHODS MANAGER

Select and transfer new technology to application managed by installing and implementing software tools. Three to six years experience as a programmer using project management tools is required.

#### PROGRAMMER ANALYSTS

Develop, install, or maintain business, academic, and hospital applications. One year experience as programmer analyst using the technology identified above.

All of the above positions require excellent interpersonal, planning, and organizational skills. A bachelors degree is preferred. Experience in a health care environment is preferred.

Send a cover letter describing the position you are applying with a detailed resume and salary history, to: Dept. of Human Resources, The University of Texas Medical Branch, Box 146, UTMB Substation 1, Galveston, TX 77558-0274.

#### RESEARCH TRIANGLE OPPORTUNITIES

RTI is a leading research organization in the field of computer-aided design (CAD) and computer-aided manufacturing (CAM). We are currently seeking experienced professionals in the following areas:

- CAD/CAM Engineers:** Design and develop CAD/CAM systems for manufacturing.
- Software Engineers:** Develop and maintain software for CAD/CAM systems.
- Systems Engineers:** Integrate CAD/CAM systems with manufacturing equipment.
- Technical Support Engineers:** Provide technical support to customers.

For more information, contact: **Dr. J. B. Smith, Director of Research**, Research Triangle Institute, 12000 Research Triangle Park, NC 27709.

#### APPLIED COMPUTER ENGINEERING TECHNOLOGY

AP Applied Computer Engineering Technology is a leading provider of computer-aided design (CAD) and computer-aided manufacturing (CAM) software. We are currently seeking experienced professionals in the following areas:

- CAD/CAM Engineers:** Design and develop CAD/CAM systems for manufacturing.
- Software Engineers:** Develop and maintain software for CAD/CAM systems.
- Systems Engineers:** Integrate CAD/CAM systems with manufacturing equipment.
- Technical Support Engineers:** Provide technical support to customers.

For more information, contact: **Dr. J. B. Smith, Director of Research**, Applied Computer Engineering Technology, 12000 Research Triangle Park, NC 27709.

#### Archtech

Archtech is a leading provider of computer-aided design (CAD) and computer-aided manufacturing (CAM) software. We are currently seeking experienced professionals in the following areas:

- CAD/CAM Engineers:** Design and develop CAD/CAM systems for manufacturing.
- Software Engineers:** Develop and maintain software for CAD/CAM systems.
- Systems Engineers:** Integrate CAD/CAM systems with manufacturing equipment.
- Technical Support Engineers:** Provide technical support to customers.

For more information, contact: **Dr. J. B. Smith, Director of Research**, Archtech, 12000 Research Triangle Park, NC 27709.

Systems Analyst for help in new or old plant, available to direct projects or programs to improve existing systems. To see how we can help you, contact: **Dr. J. B. Smith, Director of Research**, Archtech, 12000 Research Triangle Park, NC 27709.

## WWP100 Washington Water Power 1889-1989 SYSTEM PROGRAMMER

Washington Water Power, an investor-owned gas and electric utility serving Eastern Washington and Northern Idaho, has an immediate opening for a Systems Programmer in the Information Services Department.

The qualified candidate will have recent actual experience in a large IBM mainframe environment with a minimum of 5 years experience in VM/SP RPO. Must have expert level experience in installation and maintenance procedures for VM/SP and CMS in a large scale, 3090 IBM SNA environment running VM release 5 RPO. Must have installation and maintenance experience for JES2, JES3 and EXEC Procedure Writing. Must also have installation and maintenance experience for SQL/DS, VTAM, CICS, GDQM, QMF and ISPF. Will be responsible for customizing, generation, problem diagnosis and corrective maintenance of operating systems.

WWP has just completed an aggressive Information Services plan which includes a 3090/1805 mainframe configuration. The operating system environment as of 1989 is MVS/ESA, TR/SM, VM, and DB2 with a 4GL.

WWP offers a competitive salary and excellent benefits along with a challenging work environment. We are located in Eastern Washington where the quality of living is as high as the quality of the work.

To join this progressive team, qualified candidates should submit a resume and salary history to be received no later than June 30, 1989, to:

**Washington Water Power  
Employment Office  
P.O. Box 3727  
Spokane, WA 99220**

EQUAL OPPORTUNITY EMPLOYER

## ONE COMPANY.

Keane employees enjoy what all technical professionals want. The stability of full-time consulting work. State-of-the-art technologies including fourth-generation languages, databases and productivity tools. The opportunity to apply their application expertise at Fortune 1000 scientific, service, insurance companies, banks, services companies and government agencies. The chance to work for the premier project-oriented consulting company in the industry. Technical management and project management training. Competitive salaries, comprehensive benefits, 401K plan, tuition reimbursement, and vacation condominiums. For one career offering endless possibilities, consult with Keane.

## PROGRAMMERS/ PROGRAMMER ANALYSTS

## Data Processing Professionals

Consulting may be the right move for you.

Your next career move can give you greater technical specialization, a better job or continuing career progress, more responsibility and significantly better compensation.

We're Global Computer Corporation, a data processing consulting firm with current opportunities to enhance your career. We're recruiting data processing pros who are interested in consulting and who have solid programming backgrounds in one of the following areas:

- Cobol/CICS or IMS DB/DC
- DB2 or RELATIONAL DATABASE
- TOTAL DB/1
- DB2/VS1, OS/VS1
- DEC/VAX
- Limited contract and entry-level positions available

If you're ready to discuss the professional and financial advantages of a consulting career, send your resume in confidence to: Ken Parsons, Global Computer Corporation, Technical Support Services, 1500 Chapultepec Center, 250 East Fifth Street, Cincinnati, Ohio 45203 (No agencies please).

**GLOBAL COMPUTER CORPORATION**  
(612) 762-7840

Columbia University has openings for a Senior Systems Programmer and an Administrative Systems Analyst. The Administrative is IBM MVS/CICS and the Systems Analyst is IBM MVS/CICS.

### Senior Systems Programmer

Responsibilities include: system generation and maintenance, installation, testing, and system software problem resolution on an IBM 4381. Qualified individuals must have experience with this system, including MVS/CICS, JCL, and DB2. Degree in Computer Science and/or equivalent training, and a minimum of 7 years experience supporting mainframe systems, using assembly language and JCL, are required.

### Administrative Systems Programmer

Responsibilities include: creating administrative applications to use the use of accounting, including specific computer applications, providing software instructions for testing systems, and creating system software problem resolution on an IBM 4381. Degree in Computer Science and/or equivalent training, and a minimum of 7 years experience supporting mainframe systems, using assembly language and JCL, are required.

Columbia University offers an excellent benefit package, and the salary is commensurate with experience. Send resume, salary requirements, and three references. In confidence to: June 30, 1989, to: Human Resources Office, Columbia University, P.O. Box 1080, New York, NY 10027. Columbia University is an AA/EEO.

## TPF PROGRAMMERS

ASSIGNMENTS IN CONNECTICUT AND OVERSEAS

Bedford Associates, Inc., a subsidiary of British Airways, is a leading international information technology service firm specializing in management consulting and the development of high performance on-line transaction systems. We do business all over the world.

As a TPF programmer, you will help develop and expand real-time computer systems in the airline and travel agency industries. We also have a requirement for a programmer experienced with IBM TPF/3 HCP systems. These systems are being developed in Connecticut and overseas.

What you will need is at least 3 to 4 years of TPF experience and the initiative for management consulting in an innovative technical environment, a willingness to accept assignments that may take you to different areas of the globe or the world, and the spirit of adventure.

Openings exist for permanent employment and for fixed term contract employment.

To find out about our generous compensation and benefits packages, including overseas living allowances, send your resume by return air or fax to:

*Before paying bills, managers should verify that services were rendered*

Belaguered by such problems, CIT hired a person two years ago to work full-time at making sure service billing was in order. The company also purchased a PC-based software package, Computer Assets Tracking System from Bendata Management Systems, Inc., in Dallas, which has since turned

"We've been trying to get our suppliers to make summary statements matching equipment with billings," Cloonan explains. He is working to get the vendors to provide more detail or clearer formats, which vendors might consider beneficial to other customers as well, he notes. "Sometimes it's a long haul," he says. "But this whole area of billing is important because it can control MIS costs, and controlling costs means that a company can remain more competitive."

As at CIT Group, IS managers at Corning-Asahi Video

"We frequently take terminals and other equipment out, and it's been a constant battle to keep bills in line with our in-house figures. Our people have to monitor everything closely,"

ROGER PETERSON

gy trying to keep things straight."

The longer range solution is a centralized invoice-tracking system. "The best thing we can do is have a good systematic way of showing me what it is I'm paying for," Lockard says. Currently, he uses separate tracking systems for the data center and

"If they see you mean business, they'll bring more to the table," Peterson says. "It's just like a million little things. There's a lot more to negotiating these things than looking at the price list and asking, 'OK, does that include tax?'"

"There was a time when I was embarrassed to ask about these things," he adds. "But they're rarely going to tell you that you have a stupid idea. You might hit on a point where their policy is flexible."

# TRAINING

## Become an agent of change

*Training managers can propel shifts in the way business is conducted*

BY EDMOND DROUTIN  
SPECIAL TO CIO

There are at least two principal levels on which information systems training managers and their staffs should seek to contribute to their organizations as agents of change.

The first level involves discovering the potential for major changes in how the organization conducts its business.

A few years ago, some members of my training staff and I became concerned about the quality of work life for maintenance programmers in our company. Many programmers who were maintaining older Cobol and PL/I systems saw their work as boring and insignificant.

We looked for a maintenance workshop that would meet two needs: enable the workers to improve their skills and techniques and also help them feel more stimulated and challenged. We found such a workshop, sent three trainers to try it out and then brought it into the firm.

But the managers we contacted expressed no interest in such

a workshop and saw no value in our because to them, as one said, "Maintenance is just a boring, dull job by its nature."

We did not give up, though. We found one manager who agreed to send 15 of his people. Their feedback was extremely positive, and word spread throughout the shop. Other managers became interested, and we offered a managers' overview of the workshop with testimonials from people who had attended. Within three months, the workshop became a company standard for all programmers.

This kind of success is possible for anyone. The important thing to remember is that training managers and their staff members can generate positive changes in the way their organizations conduct business. The keys to the doors to change reside chiefly in your imagination. Ask yourself, what could be done in a better manner? Where do you hear complaint? How can you help?

The second level for initiating change involves effective train-

ing. What are the anticipated results of training programs? Do you expect students to say that they were pleased when they fill out the appreciation forms that we call evaluations? Far too

often, knowledge without skill will not yield much. If I know about something but cannot do it, how productive will I be? Changes in behavior require appropriate skills.

If I know about the thing and can do it but do not really care whether I do it, how productive will I be? Changes in behavior require the right attitude.

Finally, if I know it, can do it

tackling the skills.

Consider the example of training programmers to use Oracle Corp.'s Oracle or some other relational database product. If the IS unit already has IBM's DB2 or Sybase, Inc.'s Sybase, trainers probably need to provide managers with an overview of Oracle and a comparative analysis of its capabilities compared with DB2 or Sybase. This gives managers some knowledge and helps to create the enabling environment in which they will support the use of the new tool.

Next, trainers can provide knowledge and skill training for the programmers. During training, you could try to help them develop a positive attitude toward the use of their new skills.

If you want to be asked to initiate change, you will have waited too long. Examine your organization and take responsibility for instigating change and for making things better. Grab the role, fill the void, and treat your organization as though you owned it and cared for it. Then you will know the satisfaction of being a trainer and a change agent who makes major contributions to the organization.

Drouin is director of DP education & training at Liberty Mutual Insurance Co. in Portsmouth, N.H.

**T**HIS KIND of success is possible for anyone. The important thing to remember is that training managers and their staff members can generate positive changes in the way their organizations conduct business.

many trainers rely on those ratings for their own satisfaction.

The true and lasting source of a manager's satisfaction should be in forging changes in the behavior of students. But how many of our training programs do that?

I would like to suggest a model of behavioral change that may help managers see how to impart such change:  $K + S + A + EE = BC$ . Translated, the formula means: Knowledge plus Skill plus Attitude plus Enabling Environment will result in Behavioral Change.

and want to do it, but my boss will not let me, nothing happens. Changes in behavior require an enabling environment.

Trainers are in the change business, and they need to consider all pieces of the model to be sure that people can and do make the required behavioral changes.

Note that it is impossible to act on all pieces of the model in one course or workshop. Sometimes, trainers need to provide the knowledge before starting with skills training. Sometimes, they need to deal with the makeup of the environment before

## Another drop

### Tech firms continue to pay a high price for poor performance

Stock drops in the wake of company come-uppances are getting to be a weekly event in the tech sector. Last week was Ashton-Tate Corp.'s turn, with an announcement of an impending second-quarter loss because of an unforeseen inventory backlog. Ashton-Tate's stock fell 4½ points to a Thursday close at 17½. Disillusionment is contagious; Microsoft Corp. closed at 56½, down 3 points. Recovery can be quick, however: Last week's bearer of bad tidings, 3Com Corp., picked up 2½ points to close at 20½.

Continued takeover rumors moved Callinet Software, Inc.'s stock up ¼ of a point to 7¼ at the week's end. Likewise, Prime Computer, Inc. hinted of a bidder to pry MAI Basic Four, Inc.'s hostile offer: Prime closed at 16¼, up ¼ of a point. A rumor that Intel Corp. will be tapped as AT&T's leading PC supplier reached out and touched no one; Intel ended the week at 29¼, down 1¼ points.

IBM, thought to be closing in on an announcement of an i486 daughterboard, closed at 109½, up 1 point. Compaq Computer Corp. closed at 95¼, down ½ a point. Digital Equipment Corp. closed down 1½ points at 91¼.

NELL MARGOLIS

# Barrelful of Apple links targets IBM

BY PATRICIA KEEFE  
ON STAFF

**NEW YORK** — Six months after the conclusion of its self-declared "Year of the Network," Apple Computer, Inc. finally rolled out a slate of IBM connectivity products alongside plans for multivendor support that it hopes will crack open information systems wallets.

Last week's product barrage showed plans to support a quartet of strategic environments — IBM, Digital Equipment Corp., Open Systems Interconnect and Transmission Control Protocol/Internet Protocol (TCP/IP).

Apple also tipped its hat to the installed base of more than 340,000 Macintosh users by unveiling the long-awaited AppleLink Phase 2 and Internet Router. According to Apple, these two products together support as many as 16 million nodes spanning a range of hardware platforms that run over a

variety of networks.

The communications and data processing group at Hughes Aircraft Co. has a huge Ethernet network and needed relief from Apple's 254-address limit, according to systems engineer Morris Bahamut.

In all, Apple introduced 15 products (CF, June 8) and referred to related offerings from another 30 third parties.

While the announcement relieved AppleLink devotees and clearly eliminated "checklist" obstacles to Fortune 1,000 sales, some doubt linger.

Apple's entrance into IBM communications could be seriously hampered by bad timing because its introductions took place in the shadow of IBM's graphically oriented OfficeVision debut.

Don Casey, Apple's vice-president of networking and communications, criticized IBM's delivery schedule and claimed that IBM had introduced

four new user interfaces, while Apple continues to maintain the same user interface, thus sheding users from technologic underpinnings.

Industry observers are split on the potential impact of OfficeVision. George Klaus, president of Hughes LAN Systems, co-developed Apple's TokenRing card, maintains that the product will enable users to predominantly IBM shops to back MIS objections to Macintosh purchases.

Others are not so sure. They see IS opting to substitute OS-

version for the Mac. They also foresee resistance to Apple's TokenLink card as a direct-connect vehicle because of its \$1,350 sticker price. Apple has positioned the card as a gateway.

A related issue concerns Apple's announced support for IBM's Server Message Block (SMB) file-transfer protocol, said Chuck Stegman, a manager at Business-Link, Inc.'s Advanced Systems Division. Mac users cannot exchange files with DOS workstations in a gateway situation, Stegman said.

Apple could either lower the

price of TokenLink for workstation use or provide SMB file transfer independently of the network mode, he suggested.

There was also some grumbling about the lack of TCP/IP support at a meeting of Managing Apple Computers in Information Systems, a national user group. Richard Mandelbaum, the vice-president for computing at the University of Rochester in New York, said he was disappointed with Apple's TCP/IP support and complained that Apple has not yet adopted TCP/IP as a network management protocol.

## User group tunes in

Apple's focus on integration last week could not have been more timely for a group of users meeting in Chicago.

While Apple rolled out 16 communications and networking products in New York, more than 150 Macintosh users were attending a meeting of the Apple user group MACS — Managing Apple Computers in Information Systems. Attendees, treated to a video teleconference wrap-up of the product introductions later in the day, were generally pleased, if not surprised, by the connectivity announcements.

"Apple pretty much pushed their connectivity strategy along," said Joe Mandelbaum, managing director of planning at the University of Chicago, which claims to be one of Apple's largest installations, with around 4,000 Macintoshes.

During an audience question-and-answer session with a telephone link, Apple Chairman and Chief Executive Officer John Sculley fielded several questions about Apple's service organization and its intention to put more emphasis on third-party and dealer channels.

Lockheed Missiles and Space Co.'s Mike Bailey, for example, told Sculley he was concerned about the apparent emphasis on dealer channels and whether this meant a move away from Apple's national accounts organization. Sculley said, "All the economies in our industry say it's better to use resellers for many things and dealers for simpler products." However, he added, Apple will "continue to honor and support" its existing direct relationships with users.

ELLIS BOOKER

# Microsoft puts SQL in Windows

BY DOUGLAS BARNEY  
ON STAFF

**REDMOND, Wash.** — Microsoft Corp. is preparing to counter the data access rivalry of Lotus Development Corp. 1-2-3 Release 3.0 with Q+E, a product that allows Windows applications to generate SQL queries, the firm said.

1-2-3 Release 3.0, set to ship this week, contains Blueprint, a communications specification

that can also generate IBM SQL code, and will run against a variety of back-end database systems.

Q+E will work only with Ashton-Tate Corp. dBase databases at first, but it is being enhanced to access both IBM's OS/2 Extended Edition and the Ashton-Tate/Informatica SQL Server, Microsoft announced. These enhancements are scheduled to be available by year's end.

The system, which runs under Microsoft Windows, uses pull-down menus to generate queries by example, requests which are then translated into SQL. Users can also generate SQL directly for more demanding queries.

The package was developed by Pioneer Software Systems, Inc. in Raleigh, N.C., and is similar to Query, a system from Quinbase Systems, Inc.

Microsoft's initial thrust will be into the installed base of PC Excel users. Q+E will be available to new Excel customers for \$10. Existing customers can buy Q+E for \$50.

The system will work with any Windows application via the Windows clipboard or can import data directly into any application that supports Dynamic Data Exchange, said George Wolman, president of Pioneer. Pioneer is free to license Q+E to other vendors.

### Different focus

The system has an incomplete implementation of SQL and is focused on generating queries rather than providing sophisticated updating capabilities. There are no Create Table, Insert or Update commands, Wolman said.

Q+E works with both Dbase III Plus and Dbase IV, which in-

cludes SQL. Q+E does not use Dbase IV's SQL, however, which has been criticized for occasionally providing incorrect results. In fact, Q+E has two different dialects of SQL — one that is ANSI-standard and one that uses Dbase IV syntax. "The same bad features in their SQL, we will have just like them," said Wolman of Dbase IV's SQL. Wolman added that Q+E will

achieve correct results.

Beta tester Dave Hart already loves the product. Q+E is used to query data created with Excel but then stored as Dbase files, said Hart, a programmer at Caspary Analytics, Inc., an outside consultant to the Du Pont Co. pension fund investment group. Prior to Q+E, these queries were performed with macros, a time-consuming process.

## Kodak

FROM PAGE 1

real vendor relationship," said Kodak spokesman Paul Allen. "IBM has also submitted a proposal that we're looking at, but it's premature to talk about what may or may not be done."

If the contract is signed, Kodak would be the largest of several firms to turn over IS operations in facilities management contracts in the past two years. These include Enron Corp., Preproet McMahon, Inc. and Meritor Financial Corp. with EDS and Southland Corp. with Affiliated Computer Systems, Inc.

Kodak has three large data centers in the Rochester area, in one plan under consideration, and a Kodak employee, the chosen vendor would build a new data center to consolidate the three. Further stages of what Kodak is calling the "data center project" could involve some of

the 30 data centers elsewhere in the \$17 billion company's worldwide operations.

Allen declined comment on the possible impact on Kodak's IS employees. In typical EDS facilities management contracts, the customer's data center workers become EDS employees. One observer estimated the number of Rochester data center employees at 400.

The choice of EDS "would be a natural for Kodak," said Stephen McCallan, a financial analyst who follows EDS for Merrill Lynch. McCallan said EDS performs about \$25 million annually in contract work for Kodak.

The office of Katherine M. Hudson, Kodak's vice-president and director of corporate IS, referred all inquiries to Allen.

Consolidation appears to be the direction elsewhere within Kodak. Last week, the firm said it will combine its three U.S. consumer photo divisions into one unit, resulting in several hundred layoffs.

## Power play

The cooperative processing ranks continued to expand last week to include Computer Consoles, Inc. (CCI), which announced a Microsoft Windows front end to its Unix-based off-line automation software.

The system, dubbed PowerWindows, can tie users to the firm's Officepower back-end system. Both Officepower for Unix minicomputers and PowerWindows for the personal computer are examples of CCI's "open architecture" under which the firm's formerly proprietary software will run on a wide variety of hardware. In fact, Officepower will now run on any minicomputer that uses AT&T's Unix System V, a spokesman said. With a single PC, CCI's Officepower office automation tools, Unix commands and DOS programs can reportedly execute and exchange data.

According to the company, some 100,000 people currently use Officepower to handle text processing, electronic mail, database management and document conversion. A five-year Officepower license sells for \$1,995. PowerWindows costs \$650. The products are currently shipping.

## War-weary IS directors remain true to AS/400

BY ROSEMARY HAMILTON  
and ROBERT MORAN  
CHICAGO

Chances are most information systems directors overseeing IBM Application System/400 could use a vacation right about now.

For these users, particularly those coming from a System/36 background, it has been a long, hard year. Despite the war stories they now tell, however, AS/400 users are still committed to IBM's midrange system and predict a long future with it.

"Operations have smoothed out quite a bit now, but for the first four months, I wondered if I should have gotten it," said Phyllis Bordeaux, data processing manager at the IS department in Orange County, Texas.

Bordeaux's story is similar to those told by many former System/36 users. AS/400 simply would not accept certain chunks of System/36 codes. Migration aids were difficult to use, and once an application was running in System/36 mode, the perfor-

mance was at times worse than it was on the old system.

"I think we were more optimistic than we should have been," said Vincent Monito, DP director at the New York State Lottery in Albany. "That was based on IBM's marketing implications — the system for non-

Kendall's Cipolla

technical people."

From the start, however, IBM did indicate that migration would be more difficult for System/36 than for System/38. Users said they were just not prepared for the extent of the difficulty.

First of all, System/36 shops typically had less technical expertise than the larger System/38 shops because it was not required to run the less technically complex System/36. Ironically, they would need more expertise than their System/38 counterparts.

The AS/400's technical design was similar to that of a System/36, and therefore, the System/36 programs would require more work to be migrated.

IBM countered this problem in a number of ways. It worked directly with some customers at their sites and brought others to Rochester, Minn., for migration instruction. IBM also sent out dozens of Program Temporary Fixes (PTFs), intended to enhance operations in System/36 mode. In fact, it sent so many PTFs that users began complaining that it took too long to install all of them (see related story page 25).

Last week, an IBM spokesman said the company is now addressing the PTF issue and will send out fewer — and more simple — PTFs in the future.

One of the few System/36 shops that has a relatively trouble-free migration was General Co. According to Ron Cipolla,

## IBM wanna hold your hand

Most Application System/400 users point to IBM's support as the key in getting them through their tough migrations. IBM, it appears, is so determined to succeed with its AS/400 that it will do virtually anything to keep customers happy. The company even quietly instituted a policy several months ago of calling every U.S. customer after their system is installed to make sure all is well. That means IBM has made at least 10,000 follow-up calls, and that is just one piece of the support effort.

As a result of IBM's hand-holding, users are willing to take the pain that often comes with the AS/400 migration. Dennis Klinger, MIS director at Ryder Truck Rental, Inc., still has an outstanding list of improvements he wants IBM to make. Nonetheless, he offered praise for IBM's guidance and support.

James Louys, a vice-president at ADM, Inc., a consulting firm in Cheshire, Conn., said IBM has fanned over users to the point of overreacting. "They've put the emphasis on not getting a bad reputation," Louys said. "They swear problems with people and money and resources. They'd be on your doorstep if they felt it was necessary."

Kendall's MIS director, his staff was more prepared because its environment evolved from an IBM mainframe to a System/36 and then to the AS/400.

"You have to go after it from a different perspective than a typical 36 shop might," Cipolla said. "There isn't an awful lot that the AS/400 doesn't do that a mainframe does. It has more of a mainframe orientation than a 36 does."

Yet Dennis Klinger, MIS director at Ryder Truck Rental, Inc., a user site that runs IBM

mainframes along with AS/400s, said the migration was far more difficult and expensive than he anticipated. "The care and feeding of the operating system was a strain the first year," he said.

Users, however, said that with most migration problems behind them, they have no regrets. "We anticipated some rough times, and there have been," said Frank Campbell, MIS director at the Jefferson Regional Medical Center in Pine Bluff, Ark. "But we expect to be a loyal AS/400 user."

## Slump

FROM PAGE 1

brought to Rochester, Minn., home of the AS/400, for a week's worth of additional migration support. In addition, the spokesman said IBM plans to open 12 migration centers in the U.S. by the end of the summer.

"If there's one thing we could

be said of the high-end users. "It got here because of a program we had that fell out. But we've been aware of it and have been working on it for a while."

Schwartz said the 2440 tape drive, which high-end users are now using, will get a performance boost. He added that a new tape drive, developed in conjunction with a third-party vendor, will be announced.

Observers said that if IBM comes through on those promises, then it has a solid chance to build on the successes of last year.

"I would say they've done very well in most areas, with some obvious shortfalls," said James Louys, a vice-president at ADM, Inc., a consulting firm in Cheshire, Conn. "It's clear they're very sensitive to problems. They don't want a marketing mistake or an unhappy customer to give this a black eye."

Since last June, IBM has worked hard to avoid problems. In the process, it met two critical objectives with the AS/400. First, IBM finally gave its midrange users a future that made sense and thus prevented many of them from defecting to other vendors. Previously, IBM offered two incompatible systems, both of which had limited growth potential. At the same time, IBM gave no indication of which of those systems was a strategic product in the company's eyes.

Second, IBM attempted to win back midrange market share that it had been losing to Digital Equipment Corp. and other competitors for years. Analysts claim that IBM has made a respectable showing here, although they do not provide specific numbers. IBM claims that one-third of the more than 30,000 AS/400s shipped have gone to non-System/36 and 38 accounts. But it does not specify

how many of those customers were non-IBM users.

The key now is to bring over more users, from both within the IBM midrange world and from the competitors' camp. Observers said most of the installed midrange base that was ready to upgrade has already done so. Now IBM must lure those users who do not have pressing migration plans. Clearly, IBM is trying to woo them. For example, in

April, IBM quietly released a promotional offer that will give current System/34, 36 and 38 users a 20% discount on the purchase of the OS/400 operating system.

Non-IBM accounts will be a tougher sell, observers said. IBM plans a steady stream of enhancements to keep the AS/400 competitive while also playing up the hand-holding it can give users.

IBM's Schwartz names time constraints for lack of training

have done better, it would have been to do more training last year instead of this year," said Stephen Schwartz, an IBM vice-president who heads up its Application Business Systems division. "I wish we had more time to do it last year, but we ran out of time."

IBM also plans at least two tape-drive announcements this year, according to Schwartz.

"They have a real problem,"

## Coming soon to an AS/400 near you

The next big step for the Application System/400 will not come until next year, when several new high-end models and an operating system release with cooperative processing capabilities are expected to be announced, observers said last week.

IBM was characteristically mum last week on future hardware and software announcements.

However, Stephen Schwartz, an IBM vice-president and general manager of its Application Business Systems division, said the organization will forge ahead with its plans to showcase new technologies on the platform. These include image, for which pilot projects are already under way, voice and data applications and

expert systems.

An IBM spokesman said the future operating system will include support for "system coupling," which he described as "loose like clusters, rather than tightly coupled."

Observers expect new high-end models in 1990

# Information war on in China

BY PATRICIA KEEFE  
CW STAFF

"... I should tell you there is a soldier in my side."

That refrain reverberated throughout China last week as Communist Party officials sought to slum the Bamboo Curtain down across international telecommunications lines.

The information flow fostered by China's technology revolution is interfering with the government's whitewash of its bloody crackdown on student protesters.

Echoing attempts by Chinese students in the U.S. and abroad to spread information about the unrest and subsequent repression in China (CW, June 12), the Chinese government has turned to its own network of informers and is reportedly using localized computer databases to track down dissidents and "counter-revolutionaries."

"This is so clearly an information war now" between the students, their supporters and the Chinese government, said Jeffrey Stamps, a co-founder of Networking Institute, Inc., a research and consulting company based in Newton, Mass.

Networks and databases have become the main line of defense for frustrated Chinese students in the U.S. Several student groups—including two at Stanford University and the University of California at Berkeley—have set up centralized repositories to collect information flowing into bulletin boards such as Usenet's Newsworld, which can be accessed from Bittnet or Internet.

Newsworld's so-called China mailbox has generated a phenomenal amount of traffic, including messages from the Far East, said David Wesley, manager of data communications and network services at the Berkeley campus.

One example of the chilling nature of the messages received in a June 3 message from Canada, alleging 7,000 people killed in

Beijing. "Machine guns were used against the demonstrators, streets are covered with blood and bodies."

The China Information Center (CIC), an Auburn, Mass.-based nationwide hot line launched May 17, took steps hot weeks to corroborate its operations and beef up phone service. The hot line is sponsored by the Walker Educational Exchange, an international study and education center.

## Hundreds of calls

After CIC's 24-hour hot line number was broadcast by the Voice of America before and after the Tiananmen Square debacle, literally hundreds of collect calls began streaming in from within China, Stamps said. "Sunday morning as the massacre was under way, the hot line received many eyewitness reports, some literally three blocks away from the square." Since the crackdown, the volume of calls has dropped markedly.

CIC's efforts to upgrade its facilities has been assisted by donations of equipment and ser-

vices from the high-tech community. Aid has come from Executone Systems, Inc., AT&T, New England Telephone Co., Lotus Development Corp. and Ashton-Tate Corp. ComputerServe is considering donating several mail accounts.

Building a database is a top priority. "As students begin to be arrested and disappear, we are getting requests for information, such as who saw who, when and under what circumstances," said Rev. Gordon Schultz, director of the Walker center.

"If the government is admitting 1,000 are in detention now, imagine how many there must really be," Stamps added.

The database and recordings of calls are intended to provide current information and collect evidence in case international or Chinese legal tribunals ever convene to bring the architects of the Tiananmen Square bloodbath to trial.

"This massacre is burned in the brains and hearts of the Chinese. These people will find a way to get information out, and [when they do] they will need a network in which to dump their information," Stamps said.

CIC is also exploring alternative methods of relaying infor-

mation to China. "As each type of communications technology comes under government scrutiny, we try to exploit every other one, but we don't want to telegraph what we are doing," Schultz said. "Believe me, we'll use every method possible."

The use of facsimile has received somewhat as early concern that China was monitoring fax communications proved true. At Brandeis University, for example, Chinese students were fearful that by faxing information to a particular number, "it would be like pointing the evil finger at a person," said Judith Humphries, an interlibrary loan coordinator at Brandeis.

Another information highway involves access to worldwide global networks owned by multinational firms that have offices in China. "There are eyewitness accounts [to the Tiananmen Square massacre] that have come through" on the electronic network of one major computer vendor, Schultz confirmed.

According to news reports last week, the government keeps close tabs on citizens via a network of informers, area councils and, in some cases, inputs information into electronic databases.

## IS abroad unaffected, but tech flow slowed

BY MICHAEL ALEXANDER  
CW STAFF

The upheaval in China has not had a measurable impact on the information system operations of joint ventures there, but it is likely to have a chilling effect on many companies' plans to import technology and set up shop there, according to expert China watchers.

IS operations for Sheraton Corp., which has four hotels in China including one in Beijing, have not been disrupted by the unrest, said Larry Hall, director of hotel systems and telecommunications worldwide.

"When we started, we had many [expatriates] employed in

IS, but part of our agreement was to turn over operations in the hotels to the nationals, and that we have done," Hall said. "Some IS employees have had trouble getting to work, so we have employees across all departments, but it has been fairly quiet."

## Manager shift

McDonnell Douglas Corp., which has a double joint venture with the Shanghai government to assemble passenger aircraft there, relocated 51 managers to Hong Kong, said Nissen Davis, a spokesman for McDonnell Douglas Information Systems.

Co. The company's IS technology in Shanghai is limited to a

handful of computer-aided design and manufacturing workstations, and users have been unaffected by the turmoil, Davis added.

The factory is still working, though U.S. government certification of the aircraft has been suspended, he said. "There has not been a major interruption of business per se," Davis explained. "We are there to do business, and we anticipate going back to that within a couple of weeks."

China's investment in information systems technology has been relatively small. Although

Demonstrators and soldiers in Tiananmen Square

foreign technology plays a crucial role in China's efforts to boost its economy, officials there have moved cautiously for fear of acquiring outdated or inappropriate technology and accelerating an already growing trade deficit.

The International Trade Administration of the U.S. Department of Commerce calculates that exports of computer and telecommunications equipment to China amounted to only \$252.7 million in 1986.

In the past year, the U.S. government has loosened controls on exports of several categories of high-technology goods including computers, telecommunications and semiconductor manufacturing equipment. However, China analysts now predict that the U.S. may restore at least

some restrictions in political retaliation against Chinese officials for violently suppressing dissent.

One negative side effect will be that companies looking to export information systems technology into China to use in joint ventures already under way may not be able to do so, experts said.

"High-tech in China is highly regulated and most sensitive to political concerns," said Ed Marston, president of China Trade Corp., a research and newsletter-publishing firm in Cambridge, Mass.

Meanwhile, U.S. companies doing business in the U.S. have been advised by the U.S. State Department to evacuate their expatriate managers, which could leave IS operations leaderless.

## TRENDS

## Factors that have held back the CD-ROM market for commercial use

- Average score (1=insignificant, 10=dominant)
- Lack of product development innovation ..... 7
  - Too little data available; not current enough ..... 5.9
  - Cost of hardware and databases ..... 4.8
  - The optimal content/technology ratio has not been found

A survey asked CD-ROM publishers and analysts to assess their market. Results suggested that industry players don't see the market growing as fast as outsiders expect. In the commercial market, respondents said, lack of product development innovation has been the biggest obstacle.

The largest number of titles are business or industry applications, but there is a wide variety of subject matter available on CD-ROM.

Hype about a boom in compact disk/read-only memory (CD-ROM) technology has been heard for years. But the big bang hasn't happened yet. Market estimates show steady, healthy growth, but industry participants and observers see need for more work.

## Number of commercially available titles

Today, applications commercially available on CD-ROM number in the hundreds, but growth was slow well last year. Applications are expected to fare better in the coming years, as CD-ROM becomes more widely accepted.

## Topic of titles available Jan. '89

Total: 425 titles

## NEXT WEEK

In Executive Report, Joe Contorno, vice-president of Citibank NA's Consumer Services Group-International Systems, says that using workstations and IBM AS/400s as the primary development platforms enabled his group to achieve greater levels of responsiveness than was possible with a mainframe.

Photonics — optical devices that use light rather than streams of electrons to transmit data — may be the new wave in computing technology. Just as IS got used to transistors, VLSIs and gallium arsenide, here come diffraction gratings, polarizers and transphasors. In Depth explores these new technologies.

## INSIDE LINES

## China hot line needs funds

Students staffing the China Information Center, an Auburndale, Mass.-based national hot line service sponsored by the Walter E. DuPont Foundation (WEDF), have so far racked up \$30,000 in phone charges in their effort to disseminate information about the crisis in China. Supporters who would like to help defray those and other related expenses can send contributions to the "Democracy for China Fund," c/o Bank of Boston, Box 151, Boston, Mass. 02101. Vendors or computer specialists who would like to donate equipment or expertise can contact WEDF at (617) 949-5919.

## HP to DEC: Drop dead!

HP quickly rebutted assertions made at a DEC briefing last week that the plug has been pulled on Apollo's high-end workstations. "In the next 18 to 24 months we'll upgrade the CPU board — easily doubling the 20 MIPS now available" on Apollo's Series 10000 line of workstations, said Bob Wussinger, director of systems product marketing for HP's new subsidiary.

## Decision near for Data Design

Word went around last week that Integral Systems (ISD) in Walnut Creek, Calif., a maker of human resources software for IBM mainframes, had acquired Data Design Associates (DDA) in Sunnyvale, Calif., a financial applications software house. ISI had previously purchased a 20% interest in DDA. An ISI spokesman would not comment on the rumors, but DDA said the two companies are discussing a merger, although no decision is expected for three weeks.

## Interlocking sanctions

Trade sanctions could force Amdahl to quit importing supercomputers from Fujitsu Japan. With U.S. trade officials thinking about taking retaliatory trade sanctions against Japan, Amdahl officials believe Japanese-made supercomputers may be on the hit list. Although the company has sold only "a couple," a spokesman said that the company would quit importing the machines if sanctions were applied. A Japanese delegation in meeting with the trade representative this week to discuss the dispute.

## Beta right than early

A beta tester of the OS/2 Presentation Manager version of Microsoft Excel says that everything works fine, except for graphs, which seem to shut down the system every time. Microsoft is still shooting for an early summer release. Meanwhile, a beta tester of Lotus' 1-2-3 Release 2.2 has been pounding away but has yet to break the software; in his mind, the thing is ready to go, but Lotus sees August as a more reasonable release date.

## Boston Bank reshuffles, again

John Rogers, who replaced Bill Synnott in the top IS job at Bank of Boston Corp. two years ago, has himself been succeeded by another well-known manager, Kevin Moody, formerly the top IS exec at Gillette Co. Moody began consulting for Bank of Boston last year and then joined the company in an arrangement he calls a "partnership" with Rogers. Rogers departed in April and now has a senior management position at a New Hampshire subsidiary of First Deposit Corp. of California. Moody says he has taken over on an interim basis and is uncertain if he will stay. The bank declined to discuss reasons for the departure of Rogers, who was unavailable for comment.

## AT&amp;T to grab a piece of the rock

According to an attorney who is working on the negotiations, The Prudential Co. will be the next company to sign up for Tariff 12 — probably this week.

IBM is rushing out with a 486 product announcement this week (see story page 1), months ahead of the availability of the chip, does that indicate the company is really rattled by market perception that it is losing its leadership position in the PC industry? You tell us what your IBM salesmen are saying: upload info to our bulletin board at 508-635-0214 or call up News Editor Pete Barlett at 800-343-6474 or 508-879-0700.

# IT WON'T PRINT DIRTY WORDS.

## Neat-O

*Our multistrike film ribbon gives you good, clean print quality page after page.*

You've seen them. Words with dirty, poorly-formed characters that come off some printers. Well, you won't see them around here. Our multistrike film ribbon will see to that. It's the ribbon used on our 24-wire Pinwriter® P5200 and P5300 printers. It guarantees clean, crisp print quality page after page.

And clean never means dull with a Pinwriter printer. Because the P5200 and P5300 (PC WORLD's "Best Buy") have seven resident type styles, including typographic fonts. So you get print quality and type variety even an executive typewriter can't match. You also get the highest resolution graphics, and an inexpensive snap-in color option.

Quite simply, we believe dirty words should be wiped out altogether. If you agree, call 1-800-NEC-INFO. Ask about our Pinwriter printers. And please keep it clean.

KEEN

*Avoid off-color words.*

PC WORLD'S "Best Buy"

# NEC

**C&C** Computers and Communications

NEC Information Systems, Inc., Dept. 1610, 1414 Massachusetts Ave., Boxborough, MA 01719.

**The way most computers are used is an insult  
to their intelligence.**

Your brilliant computer may be dumber than you think.

The sad fact is, while thousands of businesses have hooked up personal computers to mainframes, the majority of those computers are used as "dumb terminals," leaving a vast potential untapped.

For MSA, the intelligent workstation is a promise that should be kept, which is why we are proud to introduce BrightView™ applications software.

By harnessing the power of cooperative processing, BrightView enables the intelligent workstation to perform tasks previously restricted to the mainframe. This revolutionizes the efficiency of your entire computer system, meaning each component can now do what it does best, with valuable mainframe resources freed up for more appropriate tasks.

What's more, MSA is the first company committed to delivering the most extensive line of SAA-compliant software in the industry, and BrightView is already in compliance with SAA's most advanced component, Common User Access. It yields a friendly, consistent look and feel to workstations, helping maximize your investment in both personnel and hardware.

Whatever your software applications needs are, it might be wise to call Robert Carpenter at 404-239-2000. In fact, it's really the only intelligent thing to do.
